Hello and thanks for reading.I have an ACC FC-1 remote base BCD
interfaced
with an Icom IC-2a 2meter handheld.Both are installed in an RF tight box
with feed
through caps.It was originally used with an ACC 850 controller for a 2
meter remote base.It is in excellent condition and ready to be hooked
back up to another ACC controller.
Price is $150.00+shipping.If interested,E-mail.Thanks&
73s.Shane.Ke6jz.

Andy, I'll re-post below some info on this matter that I put on this NG
in April.
73...Mike / KK5F

This seems to happen when the contact traces on the PCB under the
power button get dirty. Until you can get around to cleaning the
contacts, you should be able to get the radio to turn on with a VERY
QUICK momentary push of the button.

Cleaning the traces will take about 10 - 15 minutes, because you'll have
to open the radio (very easy to do). Don't try to spray cleaner into
the assembled radio, as there are moisture barriers to prevent that.

1. Gently pry off the nicad warning label just above the three power
pins in the back. (You'll be sticking this label back on when you are
done.)

2. Unscrew the two small screws that you'll then see ALMOST all the way
out.

3. Push on the screw heads to push out the keypad, then finish
unscrewing the screws, and remove the keypad.

4. Remove antenna, and pull off the knobs on the radio top.

5. Gently spread the radio's case outward from the rear, at the level
of the power pins, while pushing on the connector that goes to the
keypad, thus pushing the radio assembly out the back of the case.

6. You can now see the circuit board traces that lie under the power
button (which should still be stuck in the case). Wipe the traces with
some electrical contact cleaner.

7. Push out the power button, and clean it too (circular dark pad).

8. Put it all back together, reverse of above. Some notes:
a. Before starting reassembly, push out and remove the cloudy plastic
LED light guide at the top of the case. After the radio is put back
together, push the light guide back into place from the top outside.
(Otherwise it's hard to get the light guide to line up properly during

reassembly.)
b. Make sure the various gaskets are not pinched or twisted as you put it back together.
c. Make sure the PTT/display light/monitor push buttons "click" OK after you get the radio back in the frame, and pull open the rubber external power and mic covers before reassembly to avoid pinching them.

Yaesu also will send you a shortend power button for free if you contact them by e-mail (see tech support e-mail address at www.yaesu.com). This is a great item if you have problems with the FT turning on inadvertently as you carry it...highly recommended. Obviously, a great time to install it would be when you are doing the above.

This is also a good time to do the MARS-CAP mod by desoldering the solder bead that is visible on the PCB center-left side as you look at the PCB just before putting the keypad back on. (This will reset the FT and loose all programmed info, though).

2038. FT-100, price

> > It is pretty much useless.

Johnny, the FT-50RD is about the highest powered HT available. There is no other model that would do any better for you.

If you are using the original antenna, get youself an RD-98SMA piano wire whip (17 inches long, EXTREMELY flexible) from ADI-Premier. They cost about $25, but the increase in performance on 146/440 over the original is amazing. I use my FT-50 in many remote areas when camping or hiking. Often without the aftermarket antenna I might as well not even carry the HT. The RD-98SMA really improves out of band reception also, and the FT-50 does an excellent job of covering those frequencies when it has a decent antenna. The length sounds excessive, but this is a VERY thin flexible wire antenna that is lighter than the original FT-50 antenna.

Also, make sure you are using a 9.6 volt pack, preferably one of the aftermarket Ni-MH high capacity models made by Maha or E. H. Yost.

The Comet SMA-3 is also a pretty good antenna, about 10 inches long, but it is not as flexible as the RD-98SMA.

I never go anywhere without my FT-50. It's a great radio.

73 ... Mike / KK5F

2040. Comet SMA-501 1.5" antenna worst than the stock antenna from Yaesu FT-50R?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-20 00:00:00 UTC
From: jerry <jerry@noreply4anitspam.com>
Message-ID: <35e02ce5.592522@news.earthlink.net>
Source record: 134387
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

Looking for a more "compact" antenna for my Yaesu FT-50R as well as a "best" replacement antenna.

Through most of the advice I received. I will purchased an SMA-3 as the "best" replacement antenna. But at the same time, I like something more compact for outdoor activities - skiing, hiking, shopping in the malls, etc. where the SMA-3 is a little bulky to carry around.

I already know that the SMA-501 is not the greatest replacement antenna for the FT-50R. But is it really that "bad", bad enough for me to keep using the stock FT-50R antenna instead? Why would a reputable company like Comet manufacturer something like the SMA-501 if it doesn't work???!

Anybody actually did any tests on the SMA-501? How much signal strength can I expect to loose?

Model PK-232 Multi-Mode Data Controller, Operating Manual, dated 9/86, about half an inch thick, 8-1/2 x 11 glossy covered manual with 1991, 1993 and 1996 additional loose sheets. If you've misplaced your manual or bought one of the many PK-232s being offered for sale and need a manual this one's for you. $7.50 mailed USPS book rate.

PC-Pakratt-88, 1991, Program Files, 2 original 5-1/4" diskettes (can transfer to 3-1/2" before I send if necessary) with serial number. I acquired them sometime back and never used them. No manual or other paperwork. Seems to work in a DOS window under WIN 95 or you can boot to DOS. $7.50 ppd.

Buy both for $12.50 shipped together.

Ian, K6SDE
San Jose, CA area

Look at the SMA-503. It performs nearly as well as the SMA-3, but it
is very flexible so it doesn't bother you by poking you in the ribs
all the time.

On the other hand, if what you really want is an antenna that is
physically only a couple of inches long, you'll have to live with
poor performance.

They are, indeed, two different questions/quests.

> I will purchased an SMA-3 as
> the "best" replacement antenna.

It isn't the best - but it is a better performer than the stock antenna.

> ...something more compact...SMA-501...Why would a
> reputable company like Comet manufacturer something like the SMA-501
> if it doesn't work???!

Of course it works. It is of limited value, though, unless you can actually see what you want to "hit." For example, I used it at last weekend's ARRL SW Division Convention in beautiful San Diego. Worked simplex and the talk-in freq marvelously. It will probably suit your "shopping mall" needs, too. Just do not expect much out of it.

Yeah, unfortunately...

I think you have two options:

1. Buy them a 900MHz phone. (get two, when you find out how well
they work you'll want one for yourself<G>!)

2. Buy a cheap scanner & show them how easy it is for the
neighborhood scanner enthusiasts to listen in on their calls when they
use 49MHz phones...

Universal Radio carries several shortwave/communications style
monoural headphones. Personally, I use the JRC phones. New, these
are about $70 (a little pricey).

2066. 6m RFI to Cordless Phone

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-20 00:00:00 UTC
From: martyt@pobox.com
Message-ID: <35dc84dc.14123914@news.supernews.net>
Source record: 134449

I'm pretty sure I already know the answer, but...

The neighbor came over tonight (about 2 weeks after I got my FT-920 and got on 6m for the first time ever...) - he apparently has 2 cordless phones and has been mostly unable to use them while I transmit on 6 meters. The phones, of course, operate at 49 MHz.

Is there anything short of going QRT or buying him a new phone that I can do to help his problem??

I run 100 watts into a homebrew 4 element beam on the roof of my house, probably 75 feet from his house so I'm probably not helping things much. I suspect that even if I reduce power to 10 watts or so, I'll still interfere with his phone.

I tried to explain to him that there wasn't really anything I could do (suggested he read the FCC notice on the bottom of his base unit) but that didn't fly too well as you might expect. He says all he has are the 2 cordless phones and that he's basically cut off from the world when I transmit.

I suggested that he either buy a 900 MHz cordless phone or get a plug-in-the-wall phone as there weren't any other options other than me ceasing to enjoy my hobby. He left, not very happy, and I'm developing an ulcer...

Any ideas would be appreciated...

Save your money on the SMA-501 unless you are _real_ close to whatever you are communicating with. It's basically the same performance as sticking a resistor in the antenna jack <grin>. I would recommend the SRH-519 by Comet. It's SMA and the antenna itself is about the thickness of the lead inside a pencil. Very flexible and performs great. Good luck!

Body handling: HTML body converted to readable text

I have the following for sale/trade....

<1>
dx 390 radio shack sw reciever with
box manual ect....almost new works well and no blemishes

$75 +shipping

<2>
mfj 451keyboard keyer with keyboard,
wall adapter, manual, box, keyinput

sells for 99 in the mfj catalog, street retail?

$50 + shipping

<3>
mfj 564 iambic key paddle wired with
a stereo jack to be used with any iambic
keyer to get dits on one paddle and dahs
on the other

$30 +shipping

<4>
IC 22S diode programmable 2 meter radio with mike CORD ONLY
and mobile bracket with conversion paperwork for packet....I got half
way thru packet conversion and came across a ic207h with dedicated
packet port....I don't have the packet crystal needed, but the info is
in the package.....

$30 + shipping

<5>
radio shack digital power meter. Works great up to 2m
astatic D104
8 of 10 on condition with new cable.
wired for 4 pin something to ensure that it
worked and it works fine

$30 +shipped

<7>
d104m6 mobile amplified mike
7 volt battery cage broken, you can
get another from astatic for $2.00

no connetor for radio

$25 shipped

<8>
I also have about 2 dozen 4 wire
mike cords. These are the heavy duty
belden cables that I bought surplus cheap!
I will pass the cheap on to you
these normally go for 9.95 each

$3.00 per cable shipped

<9> sold

<10>
matched pair of mrf497's I was going to build a radio
with high output but the idea fizzled...***note these are the
high output transistors that are used in the hr2510/hr2600/htx100
high output mods****
I also have a matched pair of mrf492's that I was going
to build into a 6m amp, but am going the route of a
larger output radio.

497mp $50
492mp $50

or I will take partial trades

looking for....

KAM version 7 or later with software/cables
6 meter radio dedicated to 6 meter and allmode

2kw or better tuner with wire/and dual coax outputs
with meters

I can be dealt with, if you have trades, let me know

km5rt@ticnet.com

Pursuant to the same laws that govern the fax spammers,
unsoliceted mail will be forwarded to my collection agency
for a $50 fee per message. This modest fee recovers the
time lost reading the meaningless message, the brain time
to figure if it was meaningless, and the time and effort that
it took to kill the OFFENDING message.

If you like CW use it! If not, learn it long enough to make the
test then do whatever you want. If you will not be doing CW on
the ham bands, 13 WPM is probably fast enough for the test. 20
WPM will only get you 75 khz of space for voice for MUCH time and
effort...you weigh the effort to gain ratio...it is YOUR choice
If you are licensed, use whatever bands you are allowed to keep
the agencies and private companies from trying to steal them.

I am presently active on.
80-10 meters ssb voice and fm where allowed, 6mssb,6mfm,
2mssb,2mfm packet,2mfm simplex,220fm,432ssb,440fm,440fmpacket
and whatever I can get my hands on.

Also try terminating the duplexers into a dummy load and not the
antenna and see if the problem still exists.
Fiberglass antenna ??? Could be a corona problem.
If your getting a crackling noise, sounds like something arcing when
your trying to duplex.
Our local club machine has same problem here. We plan on taking down
that nice new expensive fiberglass antenna and replace it with an
antenna that is made to duplex like the DB-224-E we just purchased.
Good Luck,
Don

Many thanks to all who have replied - as I sort of expected, almost everyone recommended that the neighbor get a 900 MHz cordless phone or that I just quit worrying about it as it's clearly his problem to deal with.

Against my better judgement, I went down to the local Wal-Mart and bought the cheapest 900 MHz phone they had ($49.00) and took it over to him this evening, offering to trade it for one of his existing cordless phones that gets the interference.

There was no way was he going to take that phone from me - just "wouldn't feel right," he said. It was a friendly conversation that lasted about 20 minutes, and I let him know that he could either take the new phone, or I would get him a corded phone to use, or he could deal with the problem himself -- but one way or the other, I intended to go back to operating like I always did.

So I feel like I've done my part to preserve the neighborly relationship and have more than gone out of my way to help him. My intention is to absolve myself of this particular problem and go on about my business.

He still has some lingering interference problems on a TV and some home audio equipment when I transmit on 20 meters, but I explained how we would work through those problems, and he seemed willing to have me help solve those problems.

Anyway, just wanted to pass along my semi-successful story - he'll probably still talk bad about me under his breath, but I feel like I've done everything I can so at least I'll sleep at night with a clear conscience...

Source record: 134217

1)place xcvr face down on soft surface and remove 3 phillips screws from
back
2)gently pry up on back cover at seam to remove
3)disconnect battery plug
4)clip the red jumper. it's about 1/2" long and "U" shaped. There is
only one in there
5)reconnect battery and close up the case
6)Hold down "V/M" and "Func." keys while turning power on. This resets
the Micro.
This will also erase any existing memories
but as far as I know there is no way to
save them.
The results I got from this mod were
as follows:
Rx @ Tx: 136 to 173

2085. power supply for a mobile to use as a base?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-21 00:00:00 UTC
From: Andre Konstantinov <konstan@worldnet.att.net>
Message-ID: <6rineb$cua@bgtnsc02.worldnet.att.net>
Source record: 134218

I just thought of something -- is it possible to use a computer power
supply? The power rating (200 Watt+) seems adequate... or am I missing
something???

2086. ALTAIR Wireless LAN

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-21 00:00:00 UTC
From: ilonka00@hotmail.com
Message-ID: <35dde0dd.85506922@netnews.worldnet.att.net>
Source record: 134219

ALTAIR wireless ethernet LAN by Motorola. Two 18 Ghz transceivers with

hub, manuals, software, etc. Like new condition. These are
designed as on-prmise wireless LAN's (range ~2000-3000 feet +/-),
and run off 120VAC. Each transceiever contains RF, network
logic, and built in antenna. The remote transceiever includes
a Hewlett Packard hub, to which the remote workstations are
connected. The host transceiver connects directly to the server.
$450 + freight.

Hi All,

I have an Icom R71A which has an option board installed I would like to identify.

The board is labeled SPRINTPAK and ICOM/AD. It has a RS232 line driver IC (1488) on the board, therfore I assmue it is a type of PC interface. It connects to the CPU board and sits above it inside the radio.

Anyone know the manufacturer of this board? Is it CI-V compliant?

Regards
Aaron

2093. Heathkit DX100-U spares

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-21 00:00:00 UTC

Source record: 134226

Can anyone help please? The modulation driver transformer in my DX100-U has overheated and short-circuited primary to secondary. This is a small transformer with a tapped secondary feeding the grids of a pair of KT88's. If anyone has one, or a chassis including transformers, I'd be pleased to hear.

Thanks

> How do you like your HT? I'm thinking of buying one.

I am enjoying the heck out of mine! It was the unofficial talk-in HT of the 1998 ARRL Southwestern Division Convention in San Diego last weekend! I handled the 2-meter station at the convention for a couple hours...and for folks who desires a QSL card who hadn't already made contact with me, they were handed my VX-1R and made contact with it. No technological feat, of course...the station's antenna was thirty feet away. But folks enjoyed the radio!

I already had the ADMS-1 software. And the upgrade to the VX-1R portion is free and available on RT Systems' Web site.

You will want to immediately purchase a Comet SMA-3 (or equivalent...or LONGER) SMA antenna. The stock one just doesn't do the job well.

You will also not be pleased with the stock belt clip. But there's a gentleman in Southern California who has fabricated a sturdy Motorola pager clip to fit perfectly on our VX-1R HTs.

I had the choice of firmware v105 (demo) or v106 (new)...I went ahead and purchased the 106. I didn't feel the need to monitor cellular calls.

Do not expect loud audio - grab a Premier/Pryme SPM-402 earpiece/boom mike if you want to use this HT in the car or noisy environments. Or if you already have a speaker-mike for your Yaesu FT-50 or VX-10, it'll work with this HT. THANKS to Yaesu for thinking about accessory compatibility!

Because I am "spolied" with the ADMS software for programming, I have not had to manually program the unit. But there is a wealth of "F" key functins available very easily for each programmed channel. I happen to use one DTMF sequence a lot - and although there's no numeric keypad, all I have to do is key the mike, and press ONE button twice to initiate it. Great!

It's a fun radio. Make sure you bookmark these sites for some really excellent information:

The Unofficial VX-1R Page (a wealth of information!)
http://www.icongrp.com/~sllewd/index.htm

RT Systems' site - the ADMS-1 software folks
http://www.rtsars.com/

The Motorola belt clip improvement
http://www.icongrp.com/~sllewd/beltclp.htm

A REAL hands-on review...

> You might want to check out my web page on the ICOM Q7A, as I have a few
> comments on the VX-1R as well.

Some good information...but I sure feel a lot differently about the VX-1R than you did. Maybe it'e because I live in a major metropolitan area (Riverside, CA).

>>...[the VX-1R] is as deaf as a toothpick in the 220 Amateur Band...

Geeze, I have several 220 repeaters programmed in my VX-1R, and hear 'em all the time.

>>...FM broadcast is also much better on the Q7a vs the VX-1R...

Again, maybe it's because I'm only 50 miles easy of Los Angeles, but I can receive several FM radio stations...

>>...no TV audio on Channels 2 to 6 on the VX-1R...

Well, I didn't find this to be a problem...<g>

What drew me to the VX-1R? I already had the ADMS software for my FT-50RD. And the VX-1R uses the same speaker-mikes that I already own for my FT-50RD and Vertex VX-10. So I didn't need to invest in a lot of accessories. The only immediate purchases/changes were (a) a second battery, (b) a real belt clip, and (c) a SMA-503 antenna.

You're missing something. Most of that 200 watts is at 5 volts. The 12 volt
output is typically under 2 amperes, IE 24 watts.

This may have been the first "Remote Access" Mobile link/repeater!

In the early 80's, during my employment with Rockwell International, I build a dual band mobile crossband linking repeater using an Icom 2AT and 3A. The radios were controlled with a logic board that provided linking capabilities from 2 meters to 1 1/4 meters. Using an amplifier, the trunk mounted system provided 50 watts on 2 meters. From the drivers seat, I used a modified speaker/microphone from a Hygain CB radio to control the 2 meter rig. The microphone interfaced to a "hump mounted" console that included a 4X4 DTMF key pad. The standby current drain from the whole system was about 50 ma.

The IC-2AT was modified by installing a "D" 25 connector on the rear case. The logic board (or docking fixture) was mounted in a slim line case and mated with the connector on the 2AT. It also interfaced to an Icom IC-3A through the external mike and speaker jack. To key up the 2AT, the squelch signal from the IC-3A was DC coupled to the to the control logic. The 1 1/4 meter XMT was VOX operated. There was also an automatic ID'er, link time out, and speech synthesizer chip that read back the 2 meter frequency on the 1 1/4 meter side. 2 meter frequency scanning was also available.

When the IC-2AT's thumb wheel switches were set to 140 MHz, the synthesizer BCD lines were switched to a high impedance allowing the docking fixture to gain frequency control. When the HT was removed from the fixture, it regained normal operation. The up/down and simplex/duplex switches were also controllable. Remote frequency control was possible using DTMF tones on the 1 1/4 meter side or by keying in the same commands from the hump mounted console. I used a second IC-3AT as a hand held to communicate back to the link. With 50 watts on the 2 meter side, the link provided enough output power to work just about every repeater in the Chicago area.

I demonstrated the system to Icom at the 1984 Dayton Hamvention. I even had offers from other Hams to buy my system but it wasn't for sale. A few years later, Icom and others introduced dual band radios with linking capabilities.

A few years ago I restored the IC-2AT by removing the D25 connector and replacing the case. Eventually I sold all three hand helds at local hamfest and last year my link (the logic board and case) was disassembled and found it's way into my junk box. I now own an Icom IC-Z1 hand held and an IC-2700 dual band mobile. The linking capabilies of IC-2700 using the 70 centimeter band is very similar to my system.

I decided to revive some of the old logic boards to use as a full dulplex addition to my Icom 2700. It will use a Hamtronics 440 receiver board and a diplexer. The logic unit will interface to the 440 side of the 2700 to key up the crossband link allowing
full duplex linking capabilities. The 2700 only supports half duplex through the link.

I'm selling the entire shack. This is a buy all or nothing deal, I will
not sell individual pieces, I have the following:

Kenwood TS-930SAT w/250HZ Cw Filter
Johnson Mic
5-Elem/2M Yagi w/Rotor
MFJ-986 3KW Roller Inductor Tuner
Carolina Windom 160M Antenna
Mosley TA-33 3-Element Beam/10/15/20
CDE Rotor/Controller
HyGain 10/15/20 Meter Quad
Peter W. Dahl HV Xformer (new)
Astron 20A Power Supply
Homebrew RF-Deck uses pair 4-125's
Heathkig IG-102 RF Signal Generator
110V Variac
Thoradson Plate Xformer 1.2KV @ 1A
Heathkit DX-60B
Heathkig HG-10 VFO
B&K DC-30Mhz Dual Trace Scope
MFJ 752C Sig Enhancer
Heathkit AM-2 Swr Meter
Kenwood TM-733A dual Band mobile
Heath IP-17 HV Regulated Supply
Hand-Key -"J-38"
Hand-Key - "J-44"
Rohn HDBX 48ft Tilt-over tower complete
Pair Collis Motorized Roller Inductors
2- HTX 202 2M HT's w/hand mic & charger.

This is over $4000 worth of shack. $2500 get's it all.. you must pick up
or arrange for shipping (the tower pretty much has to go by motor
freight). I'm in NW Vermont. send e-mail if interested.

2120. Re: Best replacement antenna for Yaesu FT-50R HT?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-21 00:00:00 UTC
From: treynolds@my-dejanews.com
Message-ID: <6rk8eiqle1@nnrp1.dejanews.com>
Source record: 134253
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

One comment about the FT-50 and its antenna is that the SMA connector on the top is, in my opinion, a poor choice. SMA connectors were not meant to be connected and reconnected and they were never meant to be spun on, with the center pin spinning with the outside shield (this is what happens when you install the factory antenna). Several years ago Hughes did a study of SMA connectors for the space industry and found that they begin to deteriorate after the first couple of reconnections. (Of course, most hams do not have requirements as stringent as the space program).

What I did was install an SMA to BNC adaptor once and leave it on. It is a bit of a bottleneck and I constantly worry about it snapping off but in two years I haven't had any problems. BTW, I use a two meter half wave telescoping whip antenna that works fantastic (on two meters).

Hello All,

I have for sale:

Yeasu FT411E hand held 2m radio. It is in great condition, but I won't lie to you, the original battery pack that came with it has gone bad. It will hold a charge for about 1 hour. I also have an acc. mic, and AC pack for it. Asking $250.00 Have all manuals and original box.

Kantronics KPC-3 TNC controller for packet radio. Excellent condition. I have all manuals. Asking $50.00

Digital World Band Radio - Realistic DX-390 from Radio Shack. Perfect condition. Almost never been out of the box. Have original box and manuals. Asking $150.00

Prices negotiable
Please E-mail me if you are interested, as I do not always check the newsgroups. Thanks
Daren

>
> Does anyone have any info???
Yes it's true. Due to recent the development of the Yaesu FT-100, ICOM needed to remain competative. The 706MK11 is reduced to $9?? and the used market has dropped to $750-800. This is the way to clean the shelves. Perfect time to buy. The MK11 is a well tested radio with plenty of improvements and will be a good chassis for the added band. Meanwhile the race for FCC Acceptance is still on and the winner will be coming out on the shelves within two months. Hold on to your wallets!

Well, of course you'll totally confuse the regulator circuit, and you'd still be limited to 24 watts of 12 VDC if you got it to work somehow.

Realize that a PC supply is a switching supply, and the switching regulator is in the 5 VDC circuit, which is the high current part of the supply. The 12 V windings just go along for the ride and are capable of a much smaller current output. If you series the two, the smaller current output is the limiting factor (Kirchhoff's Law). If you attempt to parallel the two, the regulator will compensate so that the total combined output is 5 VDC.

The 12 VDC output depends on the 5 VDC switching regulator for primary regulation. It may have an additional low current analog regulator as well, but the primary 5 VDC regulator has to be working to get any voltage out of the supply at all (it's what does the switching which drives the toroidal transformer primary in the supply).

In most PC supplies, the 5 VDC output has to have a certain minimum load for the switcher to work correctly. In a PC this is the power hungry digital electronics. If you use it to power something else, you still need to load the 5 VDC line to keep the regulator working. A large low ohm power resistor is commonly used for this. This is where most of the power winds up. The 12 volt circuit is only capable of supplying about 2 amperes, IE 24 watts, even though the total supply may be supplying 200 watts, IE about 35 of the supply's amps are at 5 VDC.

2131. antenna and home help...

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-21 00:00:00 UTC
From: Tim Weaver <weavert@primenet.com>
Message-ID: <6rk7ms$r7c$1@nnrp02.primenet.com>
Source record: 134264

Here's my quandry:

Any suggestions on how to run coax/antenna line out of the house without drilling holes into the wall(s) or ceiling? I realized I have no way to get the coax OUT of the house. If I go through the window screens, I then cannot close the windows and the house alarm will have to be bypassed. My XYL doesn't want me drilling into the walls or poking holes in the ceiling.

I know that the 2m and 440mhz bands have antennae similar to cell-phone antennae, using a glass-mounted coupler to have the antenna "connected" to the coax on the inside of the vehile. This is what I will likely do if I run a fixed rig at home (or even to have an outside antenna when running an HT indoors).

My question is, are there similar set-ups available for HF antenna?

My seconf problem revolves around my home owners' association: no fixed external antenna, or anything visible from the neighbor's house (I know, shouldn't have moved, but that's a different issue). Is it possible to run a dipole under the roof's eaves as long as it stands off of the house/building?

If neither situation 1 or 2 is feasible, I may need to run stroctly mobile...I should think.

Thanks,

Tim

We are pleased to offer the following prices
on coaxial RF connectors and adapters. Minimum
order at these prices is 100 pcs. For lower
or higher quantities, call us.

BNC SERIES (0-4 GHz)

BNC Male Crimp RG58, 59, 6, or 213 (specify)
$0.59 each P/n 1001

BNC Male Crimp Right Angle for RG58,59,or 6 (specify)
$1.49 each P/n 1005

BNC Male Termination 50, 75, or 93 Ohm (specify)
$0.79 each P/n 1017

BNC Male to N Female Adapter
$0.99 each P/n 1052

BNC Male to Double BNC Female "T" for LANs
$0.59 each P/n 1077

N SERIES (0-4 GHz)

N Male Crimp RG58, 59, or 213 (specify)
$1.29 each P/n 1301

N Male Crimp Right Angle for RG 58, 59, or 213 (specify)
$1.39 each P/n 1303

N Female Solder Panel Four-hole Flange Receptacle
$1.29 each P/n 1317

N Male to BNC Female Adapter
$1.49 each P/n 1324

SMA SERIES (0-12 GHz)

SMA Male Crimp RG58 or 174 (specify)
$1.29 each P/n 1801

SMA Male Crimp Right Angle RG58 or 174 (specify)
$1.59 each P/n 1804

SMA Female Chassis Mount (four hole flange)
$1.29 each P/n 1814

SMA Male To N Female Adapter
$1.89 each P/n 1824

SMA Female to N Male Adapter
$1.89 each P/n 1833

These are only some examples. We also have other series connectors and adapters, including:

Solerless Cable
F Series
TNC Series
UHF Series
Mini-UHF Series
RCA Series
Twinax Series
PAL <TV> Series
FME Series
Mini-RCA Series
Mobile Phone Series

Call, write, fax, or e-mail us your requirements, and let us help you.

Source record: 134267

Do you have attic space? If so you can install an antenna there. Just tack it to the rafters. Be sure and use an antenna tuner.

I hope you don't have aluminum siding! If not you can run an antenna along the side of the house. Use # 30 wire. It is near invisible. You can even paint it to match house. Again use an antenna tuner.

For a two meter antenna, cut a dipole and attach it to a window with suction cups at each end. Mount it vertically. The antenna will be about 38 inches long. Connect it to the rig with a short piece of rg-58. The shorter the better.

Don't even think about using a linear. You won't have a great signal, but you will be able to operate. Think about using cw.

Be sure to use a low-pass filter and be sure and ground your rigs.

Good luck. Joe, W4VL.

Would like to trade metal detector for transcevier around $550 in value -
some tube units finals OK. Please don't try and offer a $300 piece of equipment
unless you've also got $250 cash your willing to part with.
Specifics for this unit: is about 2.5 maybe 3 years old. D/C number inside
battery door indicates manufactured around August of 95.
Software version is 1.1. Unit is in excellent working condition, appearance 8.5
out of 10. Arm pad, strap and grip are not worn or torn.

Here's a list of everything I'll ship:
> XLT, Charger, Batteries, Manuals in Hard Case
> Has coil cover and weather covers for LCD and electronics unit.
> Sand Scoop
> Small Garden type shovel
> Stainless Steel Hole Hog (precision hole digger)
> Homemade ground probe (modified screwdriver)
> Advanced Water Working Techniques BookLet's
> Talk Treasure Hunting Book
> Military type canvas pouch (clips on belt)>

The least I will take for the unit is $550 plus $20 UPS shipping if
you send a money order in advance. If you want COD then the shipping
increases $10 to cover the CASH ONLY collection charge.
To see specs and picture:
http://www.treasurenet.com/whites/products/spectrum.html

Feel free to call me if your still interested.

>Replace existing resistor at location R2-103 with Yaesu P/N J24185103.

>does anyone know if there is a readily available substitute part(s)
>for this application ?

I have the FT-50 service manual. The circuit diagrams for the control
unit do not show resistors with those numbers. The parts list *does*
list those resistors, but indicates that they are used in "version 12"
boards, which are too recent for the schematic diagram to be included.

However, I can make a guess. Resistors labelled R2002 and R2003
are in the power button circuitry, and are 100K and 4.7K respectively.
Resistors R2102 and 2103 are 56K and 10K. It's plausible that what
Yaesu has done is to replace the parts labelled R2002 and R2003 with
R2102 and R2103. But I can't verify this - my radio doesn't have
the problem, so it still has the original resistors.

If you do want to try this, any standard surface-mount resistors that
are the right physical size and have values of 56K and 10K should work.

To anyone whose radio Yaesu repaired, was it R2002 and R2003 that were
changed?

Dave

2139. Re: Best replacement antenna for Yaesu FT-50R HT?

I've heard others say this... After using BNC connectors for years, I've
found them to be far less reliable than SMA. They wear out, are easy to
disengage, and are bulky. Too big for today's small sized radios.

Motorola puts SMA antenna connectors on some of their portables (STX,
Visar, and presumably others) without apparent problems. Of course, I
don't take my antenna on and off continuously, but I've had my FT-50 since
a few months after they came out without problems.

>What I did was install an SMA to BNC adaptor once and leave it on. It is a
>bit of a bottleneck and I constantly worry about it snapping off but in two

>telescoping whip antenna that works fantastic (on two meters).

This makes me nervous... "lever arm" comes to mind. A friend was using a
RH-77 antenna with a BNC to SMA adapter (hi Bob, you're probably reading
this) and managed to make the SMA connector fail. It didn't surprise me.
I applaud the change from BNC to SMA, although even better would be a
stud-type antenna mount (a la Motorola Saber series).

> cannot close the windows and the house alarm will have to be bypassed. My
> XYL doesn't want me drilling into the walls or poking holes in the
> ceiling.

Drill a hole in a closet floor...or if you have wall-to-wall carpeting,
drill the hole in the floor next to the molding. The coax can exit to
the outside thru a vent. One _QST_ subscriber advocated drilling holes
in the floor with his .45 Automatic, but I imagine it would make a
rather poor exit hole.

As far as running a feeder thru a window, one ham I knew removed a small
pane of glass and replaced it with Plexiglas which is easy to drill for
a feedthru insulator.

> shouldn't have moved, but that's a different issue). Is it possible to
> run a dipole under the roof's eaves as long as it stands off of the
> house/building?

You can radiate RF with practically anything, but it might not be very
efficient.. Try it and see. Have you considered an attic antenna?
These work quite well. Just make sure the ends of a dipole are insulated
and away from metal ductwork.

One last go-around and then I'll give it a rest for a while....
And thanks to all the fine folks who have helped me unclutter the shack!

Icom IC-821H Dual Band Sattelite Xcvr, covers 2M & 70 CM. This is Icom's top of the line sattelite rig and works great as a base station too. In mint condition, and complete with blank warranty card, all original docs and packaging. Only $1050 Shipped.

Astron RS-20A Power Supply, 25A rated in perfect condition. Like New! $75, will split freight.

BC-601 rapid smart desk charger, and two Icom BP-173 battery packs. These packs were used as reserve spares, and have been used only one time. A complete accessory setup for someone, and priced at only $125 shipped CONUS.

Larsen Dual Band NMO 2/70 mobile antenna, including trunk lip mount, coax. Add a PL-259 and you're ready to go. Used only a few months, perfect working condition, no damage of any sort. $35 shipped CONUS.

Alpha Delta DX-EE shortened dipole, covers 40-10 meters, and WARC bands with tuner. Compact in size, I used it in my attic. Will ship it assembled so you can uncoil it and use it immediately. It is unmodified and has not been trimmed or tweaked. Since it was used in the attic, has no visible stains or corrosion. Complete with original docs. Only $50 shipped CONUS.

Ameritron RCS-8 Remote Antenna Switch. This will switch 5 antennae to 1 radio, or vice versa. Rated up to 250Mhz, I have used these for 2 meters and below with no problems. Includes local switch box, remote relay box, and I'll include about 60' of PREWIRED connector cable so you don't have to do anything but plug it in. Only $95 shipped CONUS.

MFJ extended rubber duck for dual-band HT. Full quarter wave on 2 meters for enhanced performance. Like new and fully functional. Only $12.50 shipped CONUS.

MFJ-1750 5/8 wave 2 meter ground plane antenna. This is NEW and is in UNOPENED original box. Cheapest good antenna you can get anywhere. Pay me $20 (list price) and I'll ship it ***FREE*** in the lower 48, and no tax either!

JPS NIR-10 DSP in good condition with box and docs. $80 shipped CONUS.

Icom HM-54 Speaker/Mic for IC-W32A HT, excellent $45 Shipped.

Icom HM-46A Speaker/Mic for IC-W32A HT, excellent $45 Shipped.

Van Gordon 1:1 BALUN New in the package, $10 shipped CONUS.

MFJ-8621 Packet Tranceiver, works fine as a packet rig on it's stock freq of 145.01. Unit is in mint condition, working perfectly, with original docs and box, $70 shipped CONUS.

Diamond SX-200 SWR Bridge, in as-new condition with original docs and box. $50 shipped CONUS.

The Legal Stuff:
Terms are postal M.O. prepayment, I'll supply phone # and references if requested. Shipment will be via Priority Mail for small items, UPS ground for radios and expensive items. All shipping is included EXCEPT where noted.

Thanks and 73,
Ron Ricketts WA5VFA

I have all this waiting to swap for hf receiver with digital readout for

decoding.
Drake has noisblanker board, and crystal calibrator board fitted, all
slots are full, radio works as this radio should, but it needs some
loving care has manual but not original.
Laptop also has 500mb h/drive and spare 124mb h/drive, this 386 is not
one of them big
bulky things,
it is the size of laptops that are made today.
what can i say about pro-63 except it is a pro-63.
main problem is i am in the uk, lots of excpence.
Thanks.......Jim. UK only.

I had a SMA-501 and it was useless. I recommend an Icom FA-S270A which is only 4 inches long and has the SMA mount. The top half is quite flexible. I like it so well I just bought 2 more for use on other radios. I tried it on my FT-50 and it works as well as the stock antenna. It is the best small antenna I have seen. This was the stock antenna for the Icom T-21A and is resonant on both 2 meter and 440 bands. Still available from Icom. Hope this helps.

97.1 lists 4 *purposes* of the amateur radio service. What motivates
individual amateurs to pursue any of those objectives is a matter
internal to that individual amateur. Each of us have our own internal
set of motivations for whatever we do. Those motivations are often
quite different from one individual to another. As long as an amateur's
actions further one or more of the purposes of the amateur radio
service, what motivates him to do so is not a matter of public
concern.

Brand New Portable Antenna Analyzers for sale.

Active VSWR meter giving direct readings of both VSWR and % reflected RF power.
It is designed to check the exact resonent freq. of any antenna, HF, VHF & UHF.
It has a 4 digit freq. counter and an analogue meter, with a switch for 2 freq.
ranges and 2 knobs for freq. adjustments, Fine & Coarse.
It has major advantages over a standard VSWR meter in that it sees the antenna
system exactly as the Transmitter sees it, plus the frequency is swept to see
where its resonating. Makes trimming so much quicker and easier !

For further info E-mail RTE
at rte@iafrica.com
or call (011) 882-9182 or 882-0762
or Fax 882-9182
Johannesburg.

RTE also buys, supplies, rents and repairs Comms. Monitors plus all sorts of RF
Test Equipment.

>AA1FA

When you hook supplies in series, the total output current is limited
by the lower of the supplies. In other words, if you hook a 12V/2A
supply in series with a 5V/20A supply, you get 17 volts, but at a
maximum of 2 amps. Try to draw more, and the 12V supply shuts down.
At best, you get 5 volts at 20 amps. (at worst, you get smoke<g>)

Is there a cable connecting it to the back panel?? The "thing" ajd
describes is the Icom CI-V interface which gets connected externally to
the CI-V box. U then run a DB25 cable to your com port on your computer.

You might look further @ the device & see if there are any part numers
on it. Then email Icom & see what they have to say.

Don

One evening on 6 meters, a friend hooked his analyzer to his beam,
saying "tell me what this is". One guy in the group, at least 30
miles away, could copy it fine. You'd be surprised how far it
transmits. We joked about starting a new qrp hobby,,,, using mfj
analyzers!

Source record: 134120

Earlier this year there was a fault on my PK232.Replaced ic`s U18,19,20 and U6.It worked well until yesterday.I loaded a Pakratt fax program on the pc,I now discover when I try to use the tnc with my packet program Winpack ver.6.04, all the rst lights are on,if I click on any of the program icons I get the error message.."not when in connect mode".I can connect to the BBS by typing in ..c gb----- (the local BBS callsign)the program downloads the bulletins but it won`t store them.I have done all the routine to clear the tnc,removed JP1 and some ic`s for about five minutes,but alas when I switch the system on,all the lights are still red.If I type a "*" I can get the program too print out the AEA bumph and also the message saying the tnc is using defaults.As far as I can make out the tnc is locked in Host Mode and I cannot get it too return to normal.
As most will know the Winpack ver.6.04 packet program is automatic.You click on the connect icon and the program connects to the BBS.You don`t have to do anything more,it connects and starts to download all the bulletins and stores them,then disconnects from the BBS.You then double click on any message you want to download and read,re-connect and the full message is downloaded and stored,which you can read at your leisure.
Other than being stuck in Host mode the tnc works ok.It works perfect with PCPakratt for Windows and all other programs.
Would be grateful for info how to get out off this difficulty.I know one amateur who had the same fault,he disconnected U2 for five minutes and the tnc worked ok afterwards.
My pc is a Pentium11...233MHz etc.

<snip closing>

Some of this discussion/argument has become matters of semantics. Your final comment is pretty much my main point. That's why I proposed that a Ham's motives should mesh with the official purposes of the Amateur Radio Service (my last posting, probably made after you wrote the above).

I can't (won't) individually reply to all the rebuttals I have received on this. I think it's got to the point where we may each be interpreting the others comments in the extreme. The one comment I *would* appreciate hearing with any rebuttal is whether or not the

writer's motives and activities as a Ham do or do not mesh with the official purposes of Ham radio. If they do, then this thread reminds me too much of a Monty Python movie, and I'm outta here.

2192. Need a 7mhz crystal

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-22 00:00:00 UTC
From: Butch Magee <butchkay@netdoor.com>
Message-ID: <35DEC939.EDA41D58@netdoor.com>
Source record: 134129
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,rec.radio.amateur.homebrew,rec.radio.amateur

I have tried to contact Dan's in Montana, but they do not answer phone, fax and no email address. Could anyone tell me where I may buy a single 7MHz crystal? I need one that has pin spacing a wee bit less than 1/4 inch. The socket for it is actually a 3 pin transistor with the spacing mentioned.

many thanks,

Butch KF5DE

2193. need HTX-100 manual

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-22 00:00:00 UTC
From: mick@ionet.net
Message-ID: <6rmhlqcas1@ionews.ionet.net>
Source record: 134130

Fellow amateurs,
I have an HTX-100 that has served me well for a number of years but has gone South on me. Radio Shack says they cannot get the part any more to fix it (does that surprise you?). Anyway, a local says he'd like to give it a shot. I cannot find my manual anywhere and need the schematic. Anyone willing to sell me their manual or let me borrow it (will gladly pay for temoprary possession) long enough to make a copy? I have searched radio shack's web site and apparently they do have an online parts list bu no schematic.

If you are so inclined to do this please contact me:
by email - mick@ionet.net

or snail mail at
Bruce A. Stafford, Student Doctor (KE5NT)
9800 Hummingbird Lane
Oklahoma City, OK 73162-5624

and state your conditions.

Most appreciatively,
KE5NT

I finally received my operators manual from Sams and notice that it says the finals in the kenwood TS 820S are S2001A's . For some reason I have always thought they were 6146B's. I don't want to go to the trouble of opening the case just to see so I thought perhaps someone might know which tube is the correct one? I see 6146's available but no where do I see S2001's.

Richard,

The S2001A designation is a Japanese one. The 6146B designation is the American one, not to mention many other countries.

(Have one TS-820S. VFO and speaker enroute. Picking up a second TS-820S soon.)

2200. Yaesu 411 battery question

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-22 00:00:00 UTC
From: hamish@moffatt.nu
Message-ID: <6rmoo4$35r$1@emu.cs.rmit.edu.au>
Source record: 134137

I just bought an FT-411 today in Australia.

What is the story with charging the batteries? I have an FNB-14
(7.2V 1Ah), it has a charge socket on the back. I got a plugpack
marked "NiCd charger output 12V 30mA" with it; does the FNBxx
include regulation circuitry ie will this charger be appropriate?

I also have the PA-6 car charger/adapter, do you know anything about that?
It seems to power the radio fine, using a 9V DC plugpack, but will it
charge the FNB-14? Does this thing do intelligent charging or will I need
to shut it off in the right number of hours, and how many is that?

thanks

Hamish

No points for being specific Butch, assuming you want a xtal for somewhere
in 40m and not one for exactly 7MHz you can try the following site. The
crystals they have are the small type that will fit your transistor socket.

Hello Richard,
The S2001 is the Japanese equivalent of 6146B. Toshiba and Hitachi and Matsushita
(Panasonic) all used to make this tube. It is exactly same as 6146B.
Best luck to you.

>At best, you get 5 volts at 20 amps. (at worst, you get smoke<g>)

And that's only true if the two supplies have separate grounds, so
you can connect the ground of the 12 V supply to the output of the 5 V
supply, or vice versa. PC supplies often have a common ground for
all supplies.

This radio works well in the HAM Bands using substitute 6146B or W tubes.
However, this tube will fail in short order if operated in the "freeband" range
of 27.404 MHz- 28.000 MHz. The interelectrode characteristics of the tube cause
violent self-oscillations. For satisfactory CB use you must find the very rare
original Japanese S2001A's.

Message-ID: <6rn4lv$k0i@garcia.efn.org>
Source record: 134152

My two cents worth on the VX-1R. I own two of these and know several people who use these for everyday radios. My own experience is very positive. I am able to hit most of the major repeaters within 15 miles of my location with no difficulty using the stock antenna. Audio quality is excellent with "almost" full quieting into most of the repeaters. The ease of operation is quite good and it has features that others should have, such as the band search. This radio is not meant to be a scanner! The limitations of only being able to scan one band at a time hasn't been an issue for me. The "allowanyband=1" mod has not really worked that well. It seems that Yaesu had a reason for not allowing this feature, on mine it appears that the receiver on each band does not recover quickly enough to allow for dual band scanning, thus sometimes it will miss some activity.

I use my VX-1R for my everyday work (radio technician) and really like the DCS and CTCSS options. Its very small and packed with so many features that it is an indispensable "tool".

Sensitivity has been an issue that has been brought up in the thread. Yes on 800-900 Mhz its not that good. And the stock antenna has a very narrow range especially in the VHF range. It drops off very quickly above 150Mhz, but works fine for the 2mtr band (don't forget its originally designed for hams!). The UHF range is excellent over the full range. I've put both of mine on my service monitor and they both have very good sensitivity on VHF and UHF. Its the antenna that seems to be the limiting factor for using them in the VHF business range. Replacement of the stock antenna with a Diamond SRH815 improved mine dramatically. Pickup of NOAA broadcasts is excellent now.

Modifications to the newer version A106 is easy! The patch that is on the VX-1R page works excellent. My compliments to the author, he put alot of work into the patch. No you still can't restore cellular, but if you really need to listen in, you can receive images just as clear as the original signals.

I've owned several other micro's from the C508 to the Alinco SJ series. They work well, but all suffer from low power output due to the AA batteries. I was lucky to get 100mw from my C508 after using it on the alkaline batteries for 1 hr. Same with the Alinco series. The VX-1R delivers full output 400-500mw through the whole discharge cycle of the lithium-ion battery. This is very important when using such a small radio, you need every microwatt you can squeeze out of them.

Well enough of tooting Yeasu's horn. I have enjoyed my two VX-1R's and my wife and I will not part with them. They are a good value for the money and wonder what Yaesu might have in store for future models!

Typical deal... moved into an apartment to work in CA for a while, so I'm going to put radio stuff on the shelf for a while. I've got a 520S in great shape, and also an SR42-A 2M transciever with seperate xmit VFO, and a "T.O. Keyer" (for those of you into tube stuff :). I'd like to get enough money for said items to overcome having to get rid of them, but they've pretty much collected dust in my closet, and I'd rather somebody made use of 'em. Located in Sacramento.... Make an offer!

>
> But how ?

Steve:

I know nothing about your particular radio, but I've been studying this for both my IC-706 and FT-847, since I need to do the same thing, but to a much lower output power, to drive a transverter.

The short answer is that you need to obtain a source of adjustable NEGATIVE voltage, feed it into the ALC input, and adjust this voltage from zero to a more and more negative value, until the output power of the radio is where you want it to be.

Of course, on SSB there will be NO output power at all without a signal, which makes things a bit challenging. You could scream into the mic at the top of your vocal capacity while twiddling the negative voltage to the ALC input. Chances are good that a better way to deal with this is to switch the radio to FM mode temporarily, since the full output power will be generated with or without audio, as long as the PTT is held down. The hope is that if you adjust to 10 watts on FM that this will translate to a maximum of 10 watts on SSB. Besides, you might even want to run FM through this amplifier someday.

I suppose that your circuit could be as simple as a 9 volt battery with the positive terminal grounded, and the negative terminal connected to one end of a 10K potentiometer. The other end of the pot is also grounded, so the 9V battery sees 10K all the time. The center wiper contact of the pot goes to the ALC input of the radio. This allows you to generate anything between 0 and -9 volts of ALC.

One SERIOUS shortcoming of this approach is that if you turn on the radio and the amplifier one day and start transmitting without looking first, if the 9 volt battery has gone dead, so will your amplifier. (No ALC or not enough ALC to limit the output of the radio, giving one fried linear amplifier.)

If you are willing to spend a few bucks, you could buy a "TIB-CK" (Transverter Interface Board - Complete Kit) from Down East Microwave to do the job. It's overkill, since it includes circuitry to split

a single antenna connection to a separate Tx and Rx line (needed for their transverters). The part of the circuit that is essential for your application is mostly a 78L08 regulator IC that brings a +13.8vdc power line down to 8 volts of regulated voltage. This feeds into a tpe 7660 IC that changes the positive voltage to negative. The output of the 7660 then goes to the 10K pot like I described above. For more details, surf to { http://www.downeastmicrowave.com }. The usual disclaimers apply, I don't work for them or have a financial interest, I'm just a satisfied customer, etc.

Of course, you can get fancier, for example, adding to the circuit so that if the ALC circuit isn't powered up, the external linear amplifier can't be turned on either, using a relay to the amplifier power line, etc., if you are really paranoid.

Good luck on your project.
John (KB0ZEV)

Source record: 134160

I missed the majority of the original post...

If possible, first measure the port to port isolation, it should be at least -90dB for
two meters. That will at least verify that the duplexer is in spec. Measure the limiter
voltage on a weak signal with the transmitter off and on--if the limiter reading drops
you have desense. If the limiter meter rises you have a noise problem.

Check the system using a good quality dummy load in lieu of the antenna, beware that
many cheap "dry loads" make excellent noise generators!!!!!! Inject a weak signal using
a lossy coupler, and see if the desense problem has cleared. This will either prove the
antenna/feedline or loose tower components as being the culprit, or a problem in the
transmitter (spurious noise, a a problem with some poor solid-state designs) or the
duplexer itself.

I rarely find probllems in the higher quality commercial duplexers. I have seen expensive
commercial antennas turn to crap in less than a year in repeater service, however!

Source record: 134168

Hello Hamsters,

Wanted to send thanks to all those that offered useful information towards my purchase of my first QRP rig. Was looking
for a 20 meter phone kit.

Decided on a 'Small Wonder Labs', White Mountain model, 20 meter SSB kit. Also have ordered an Emtech ZM-2, 80-10 tuner.
Both will be mounted in a carved wooden box with a flip up lid. Should be an interesting project. Expect that I'll try
20 meter, QRP, SSB, Worked All States first. Maybe I'll even find the last three states toward my 5 Band WAS.

Mention must be made of Small Wonder Labs. Dave, NN1G shipped my kit upon receipt of my personal check (no 7-10 day
wait). I emailed him today since I wanted to add something to the order. Told him I would send another check. He is
shipping me the extra parts on Monday, BEFORE the check even gets there!

WOW!

The radio community deserves to know about this level of trust (especially towards a new customer). I believe that we
should all be true to our word (i.e. the check is in the mail) but in today's environment, NN1G, is to be commended.
Well, done Dave. Next time I look for a project, Small Wonder is the first place I'll look.

I expect my ICOM 765 to be lonely for a while.....

73 de Rick, W1TY/(soon QRP)

That makes no sense at all. The problem with interelectrode capacitance
occurs as you go UP in frequency. If the radio with 6146s works above 28Mc,
then it won't have a problem below.

Just had a quick look along this thread. Yes Rich, you are mostly in agreement with each other. Semantics gets in the way of conveying info in written form. There's no body language.

I am not familiar with the rules and regulations governing the "hobby" on your side of the pond. To tell the truth I am not very familiar with the R's and R's on this side of the pond either. But the profit motive is behind ALL applications to become a radio amateur. Everyone hopes to GAIN from the effort one INVESTS in the hobby. Non-financial gain, of course, in 99.9% of the cases. But there's nothing wrong with combining business with pleasure and making an HONEST living out of it.

But as someone has already said or implied, an individual's motives should be, and nearly always are, entirely private. What we should worry about is the Government's motives in allowing and regulating the hobby. Regulation is obviously essential. But what are Governmental motives? If there's anything documented then it's usually so deliberately ambiguous and vague that I don't believe it. Do you? If Governmental motives should change for any political reason, due for example to the sexual habits of government ministers, prime or otherwise, or to the circulation statistics of newspapers, or to the popularity of TV so-called news programs, then we are in danger of losing our hobby. What guarantees do we have, with our CB associates, against being relegated to and dumped permanently on the Internet !

Whoever controls the World's means of communications also controls the Earth.

Regards, Reg, G4FGQ

2238. Looking for Mods for the ICOM IC-T2A VHF HT?

2239. Poor Audio on IC-551...fix?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-22 00:00:00 UTC
From: nx7u@primenet.com
Message-ID: <35df51f3.29809939@news.primenet.com>
Source record: 134176

I have an IC-551 6m xcvr that works great, except for that the mic
gain control has to be set right on the exact pot wire winding to have
decent sounding audio. ANY rotation away from that setting is either
practically unmodulated or splatters coast-to-coast.
Reading thru the original QST product review, I noted that the
reviewer's rig has a similar problem...at least they mentioned getting
reports of very poor audio, which ICOM fixed right off but didn't
offer an explaination or details.
Is this a common problem for this radio? If so, does anyone know of a
fix?
Thanks in advance,

Scott Townley

Message-ID: <##yNyvjz9GA.294@upnetnews03>
Source record: 134181

The HTX 202 is a great radio to own even though it doesnt have a lot of bells and whistles. This is what I know...
1. The HTX 202 is NOT modifiable......AND has a great front end.
2. Even other hams will agree that all mods posted dont work on all radios.....I know....I've tried on a kenwood and yaesu
3. The service plans offered by RadioShack will cover batteries as needed....unlimited service (excluding lightning and abuse) and replacement if necessary....No radio should have had to go to the service center 4...5....6 times....Normally 3 times is the limit and a phone call is all that is needed for replacement but the final decision is the other person on the other side of the phone. Also ask if there is an alternative RadioShack service center that it can be sent to if they know that their normal center of use has new techs....you may have to wait a while longer but would probably be happier.
4. I had an HTX 202 and sold it to a new ham and bought a Kenwood TH79AD, then bought a Yaesu FT50rd....now I'm back to old reliable the HTX 202....By the way I have the service plan and I'm not paranoid.
5. The hobby is fun....find a good group of people in a club that is interested in the advancement of the hobby and your future in it. Some people are clickish and I guess you'll find that in every aspect of life but you dont want to just depend on QST etc for your experience....nothing beats a ham telling you about their experiences.

Have fun!

> stores and they have been of no help.

A local walk in electronics store, C&G electronics, sells them in the "network adaptors" section. They go for $5. The ones sold are made by Caltronics and are part number 46-634. The only information I have about Caltronics is what's printed on the little plastic package, "Canoga Park, CA, 91304".
Caltronics also makes a SMA to UHF (SO-xxx-whatever) adaptor. I forget what the part number is on that. Also, they have all sorts of male & female combo versions of SMA to BNC, SMA-SMA, BNC-SMA, etc, etc, for those who are interested.
You can call information, get their number, then when you call them, ask to have a free catalog sent to you. That way you can see all of the types of adaptors that they have.

From: rick1959@juno.com
Message-ID: <6rl39usjt1@nnrp1.dejanews.com>
Source record: 134298

Hi Dave,
I'm a bit peeved (you can make your own substitution :-), that Yaesu has made this such a "clandestine" repair.
I must be naive to business practice, but why is that they are so mum to being public about it ?
Having received several direct e-mails that give various ways that the individuals have "found out" about how to fix this, it ALWAYS seems Yaesu has made it tough get the info.
If it weren't for the FT50 being a teriffic radio, I'd of dumped it for something else.
Thanks again for the info and I'll compile it toward getting it right.
73's,
Rick N1YYH

Hallicrafters SX28 receiver. Clean cabinet and panel, and in running order, and all original knobs including steering wheel tuning knobs. This one has had some electrical modifications which are documented. A product detector was added and I might ad, works nicely. Its interesting (and nice) to hear sideband on this set without having to ride the rf gain control. Shipping and packing extra.

no problem just tell us that it is on ebay so we can delete the
message instead of retrieving it and having to delete it.

Pursuant to the same laws that govern the fax spammers,
unsoliceted mail will be forwarded to my collection agency
for a $50 fee per message. This modest fee recovers the
time lost reading the meaningless message, the brain time
to figure if it was meaningless, and the time and effort that
it took to kill the OFFENDING message.

If you like CW use it! If not, learn it long enough to make the
test then do whatever you want. If you will not be doing CW on
the ham bands, 13 WPM is probably fast enough for the test. 20
WPM will only get you 75 khz of space for voice for MUCH time and
effort...you weigh the effort to gain ratio...it is YOUR choice
If you are licensed, use whatever bands you are allowed to keep
the agencies and private companies from trying to steal them.

I am presently active on.
80-10 meters ssb voice and fm where allowed, 6mssb,6mfm,
2mssb,2mfm packet,2mfm simplex,220fm,432ssb,440fm,440fmpacket
and whatever I can get my hands on.

Phil
Talk back is one of those stupid CB things. The speaker is not muted during transmit. Look for a small value resistor that may have been tacked on somewhere near the audio switching. You can get a schematic of the radio and figure it out for yourself I would think.

Ernie, I have a nice Ten Tec Corsair II HF tranceiver for sale. It works 100% and comes with the manual. It was just recently reworked by Ten Tec and sounds great. On a 1 to 10 scale this one is 9.8 Would you be interested in a trade. The value of the radio is around $750 so I would expect $200 cash difference. Same rules as you listed below for the transaction.

From: clintbrad4d@earthlink.net
Message-ID: <6rq7n7utq1@nnrp1.dejanews.com>
Source record: 134010

> Used ADI 600HP HT
> Spare battery (ADI battery, not a cheap imitation)
> desktop fast charger
> $460. value - selling for 390. firm...

Let's see...a NEW ADI HT is $300.00, and a NiMH battery is another $40.00, and the best charger around - the Maha MH-C777a is another $50. - totalling $390.00 brand new and warranteed.

Maybe that's why you've had to post this again this weekend - you need to re-think your pricing.

If you do not need the cash right away - but could use a deduction at tax time in April - please consider donating your equipment to your local middle school or high school Amateur radio club.

- Clint Bradford, KE6LCS

S-2001 is the Japanese version of the 6146A. You can use 6146A's 6146B's, 6146W's or 8298A's.
IMHO the 6146W has the best stability & life span.

ARRL used to have tube cross references in the hand book. They quit doing that since "nobody"
uses tubes at all, any more.

2265. Kachina 505DSP Question

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-23 00:00:00 UTC
From: Paul Christensen <paulc@mediaone.net>
Message-ID: <db1E1.442$Xt4.3227272@news2.jacksonville.net>
Source record: 134014

I recently purchased a Kachina 505DSP transceiver. Although everything appears to operate normally, I notice that as the heat-sink approaches 40-degrees Celsius, the fan will switch to high speed, sometimes in concert with my CW sending until the block reaches approximately 42-degrees where it will stay in high-speed. Then it will switch to slow speed once the temperature drops to below 40-degrees after the transmission.

So, the fan intermittently switches to high-speed in sequence with my CW keying (or somewhat close to it), between about a 2-degree temperature window. Have any other Kachina 505DSP owners noticed this? Thanks.

Has anyone out there had any problems with the PS50 power supply???

I use it with the Ts440S and it occasionally blows 20A internal fuses when
I
use the antenna tuner.

THis is supposed to be a heavy duty tuner and when I tune
I set the carrier level to the minimum.

Any answers appreciated.

Thanks

From: cgibbs@freenet.columbus.oh.us
Message-ID: <6rq86g$smh@login.freenet.columbus.oh.us>
Source record: 134018

Finally got my first HT and realized that I need to have a better antenna on hand than the stock rubber duck type.

I only need 2M, and would like some 'expert' advice on which antenna would be the best all around replacement.... I'm willing to go with one of the "you can use this extended or not extended", I just don't want to have to measure it each time like some multiband antennas...

Thanks in advance for the help.

I have an old mag mount base which is missing the actual antenna portion. I want to use a piece of spring steel wire to make my own whip for it. I would like the antenna to be resonant on both 2M and 70cm. Can someone help me figure out how long to make the whip? Also, I've noticed that many many dual band antenna have the antenna coiled in the middle of the antenna. Is this really necessary? Suggestions would be welcomed and appreciated!

Hello,

I will buy a HF transceiver in the near future and have a look at
the Yaesu FT 920/FM.

I had got the papers about it from Yaesu and also read some test
articles but I'm also interested in practial reports.

Is there someone who uses this transceiver and could tell
his experience about it?

Cross-posted to: rec.radio.amateur.boatanchors,rec.audio.tubes,rec.antiques.radio+phono,rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.swap

I have for sale a Hallicrafters SX-101 Mark 3. This one is a great example of Hallicraftersï¿½ first receiver produced to exclusively cover the Ham bands. Covers 160 thru 10 meters, 14 tubes, dual conversion, crystal calibrator, S-meter, selectable sideband, ANL, BFO, and Notch filter. This SX-101 MARK 3 is in beautiful cosmetic and operational condition, chassis is very clean. Less than normal top scratches, faceplate is beautiful. Tuning knob has two small chips in the outer rim, otherwise, front panel appearance is near perfect. Overall, I rate 9.5+. With original ownerï¿½s manual. This receiver is very heavy, approximately 75 pounds. Guaranteed not DOA, otherwise sold "as-is". No warranty implied.

This receiver is not for bid at eBay Auction, I am selling it direct. I am asking $275 for the receiver, but feel free to make an offer. To see several photos of the SX-101, please follow these links:

http://mh102.infi.net/~k3458/index.html/front3a.jpg

http://mh102.infi.net/~k3458/index.html/chas2a.jpg

http://mh102.infi.net/~k3458/index.html/close.jpg

Note: yellowing in photo along edge of faceplate is a camera problem, not actually on the receiver.

Please email me to make an offer.

Thank you,
David

I don't know for sure because no one who has a new one has informed me that it can be modified. The old hardware mod where you remove a chip resistor and go into the radio's settings can no longer be done.
But there's still a very good chance that you can do the software mod to the radio. You'll need the computer interface cable to do this, and you only need do it once because resetting won't undo the mod.
I post the software mod once a week, in the form of a FAQ. Interested in giving it a try and telling me the results? The whole FT-50 community will thank you for the contribution.

From what I've read, you can still do the MARS/CAP mod to extend the transmit range. What Yaesu *has* changed is to make it more difficult to tune cellular phone frequencies.

But I don't know for certain - I have one of the older FT-50s.

eric_fre@hotmail.com writes:
>Very surprising considering it shorts out the mic and a digital line!
>a stero head phone plug actually PTT's!!!!

I've tried using a plain 2-conductor phone plug on the FT-50.
Surprisingly, it does *not* cause the radio to go into transmit,
and the radio is seems to work fully as a receiver. But you can't
transmit with it - the PTT button on the side just doesn't work.

My guess is that the firmware looks at the PTT line on power up,
and if it's active the firmware ignores it, on the theory that
somebody has shorted the jack. But the two PTT circuits aren't
independent enough for one to work with the other one shorted.

Yaesu does make an adapter, labelled as being for the VX-1,
that splits the 4-conductor plug into the 2 standard plugs used
by most speaker mikes. You can plug headphones into that.

Dave

2280. Help needed with FT-73r tuning...

I need some help for a friend. He just picked up a FT-73r, and wanted to mod it so that he could listen to his businesses freq but not x-mit on it. However, the radio dosen't work much outside of it's designed limits. RX drops off pretty fast. He says that there's a pot inside that'll widen the radio's RX and TX up. But without the service manual, figuring out which it is isn't easy. Can anyone help him out? He dosen't have internet access, nor even a home computer, so I'll relay messages for him.
P.S., if you think he's doing this to mess around with other freqs, he's most definately not. He's 67, and he's a Vet who strongly believes in not breaking the law. I've known him long anough to know that he's straignt. Besides, as a precaution, he's going to set the Tx freq to something so far out of band that TX power will be 0 watts. With this ht, that's easy.

I'm looking for radios at bargain prices not fair prices. If you would like to get rid of you radio immediately please e-mail me with DETAILS. BTW, in many cases I'll FEDEX the money order allowing you have your money order the very next day.

Here's what I generally like to know about the radio:
1. Does it work fully?
2. What does the outside look like?
3. What exact frequencies is it on and PL?
4. How many channels is it?
5. Does it include the battery?
6. Does it include the charger?
7. Does it include the antenna?
8. Are all knobs attached securely?
9. Can you give a DOA warranty?

If you can't give a DOA warranty, don't contact me unless the radio is $5. Bulk sellers please don't e-mail your weekly specials. THANKS AND GOOD LUCK TO ALL!!!

No body language. No inflection in the voice. Disjointed
communication.

I generally avoid policy-type discussions like this on the Net. They're
awkward, and in this case, they belong in a different newsgroup. [Even
"free speech" has a preferred forum sometimes, and some topics are out
of place in some forums.]

> I am not familiar with the rules and regulations governing the "hobby" on
> your side of the pond. To tell the truth I am not very familiar with the

In a very broad sense, I agree. With skillful semantic haggling,
however, one could make you sound like a real ogre for writing that.
;-)

> But as someone has already said or implied, an individual's motives should
> be, and nearly always are, entirely private. What we should worry about is

> that I don't believe it. Do you?

Sometimes I do; sometimes I don't. For the most part I disagree with
you here, but the situation may be different on this side of the pond.
Looking at the Amateur Radio Service regulations and the laws and
regulations pertaining to radio as a whole, I find the government's
motives to be reasonably clear and plainly stated. And they're easy to
find nowadays. Much of the regs and the preliminary considerations
(published in the Federal Register) are available on the Net.

> If Governmental motives should change for
> any political reason, due for example to the sexual habits of government
> ministers, prime or otherwise, or to the circulation statistics of
> newspapers, or to the popularity of TV so-called news programs, then we are

> in danger of losing our hobby. What guarantees do we have, with our CB
> associates, against being relegated to and dumped permanently on the
> Internet !

There's a balance to be achieved here that is tough to come by.
Sometimes things change willy-nilly (as you note), but sometimes
much-needed changes seem to plod along. Change here seems to be more
like a pendulum swinging between extremes than something steadily
progressing toward balance. Some say we have to expect that in
democratic systems.

> Whoever controls the World's means of communications also controls the
> Earth.
>
> Regards, Reg, G4FGQ

As per Goebbels, Stalin, and other "great" world figures. Fortunately,
I don't think we're at that point.

Hmmm lets see what happens when I key my 5 watt UHF HT or my 25 watt
base/mobile rig up and the antenna is next to his precious PC...
Lets see WHO bothers who more.....and then TRY to get rid of
the problem!
I can take my HT with me....I cant do that with my tower PC....
I can bike ride with it......cant do that...(unless I have a cheap
portable....anyone try to type and read while walking or biking?)

I can contact people all over the world when the phone lines go dead..
Cant do that with the Web! :)

You're right Bob....he doesn't have a clue.

That makes no sense at all. The problem with interelectrode capacitance
occurs as you go UP in frequency. If the radio with 6146s works above 28Mc,
then it won't have a problem below.

I did think about it. I did NOT make the assumption that this was a question from a non ham. I ascribed the benefit of the doubt and admitted the possibility
that it was a genuine request of a new ham that simply doesn't know. Starting into the hobby with used gear is no reason to be subjected to intentionally erroneous information.

Hello,

I have a fellow Amateur who is running a TS-930s rig.

He is having problems with it. The display is completly
blank. Now I understand that this can happen when the
PLL unlocks.

Does anyone know how to 'reset' the radio ?

Or better yet, anyone know what could cause this problem?

Other technical comments notwithstanding, the crack-up here is " ' violent' self-oscillations."

IOW, will the radio explode in anger if operated in the "freeband" range?

You'll note that I did keep mine until the IC-735 came out. Ignoring the receiver
crunching problem for 75m net use, it was a fun radio. But that was a serious
objection in my view. It really did crunch compared to the R4C or the IC-735,
and you can get either one of them for less than the poster was asking for
his IC-745.

>WRT phase noise, I would like to direct you to an article in the 1990 ARRL Handbook,

>units to test.

I don't think so. But it may be that the "good" range simply wasn't good enough
when the offending signals measured in volts on the antenna. I needed a receiver
with *excellent* performance.

I must say also that I was motivated to post primarily because I was peeved at
the amount of for sale traffic in a discussion group and that poor fellow just
happened to be the one I picked on to "discuss". That was unfair of me, but
I am serious about the receiver crunch issue and about the fact that there
are better radios out there for the same money.

He's just pulling the guy's chain, Bob. But it certainly is possible to have parasitic oscillations at one frequency while not having them at higher or lower frequencies. The critical factor is the self-resonance frequency.

Hello name is Dennis.
I have for sale a Kenwood SW-2000 swr/pwr meter with the standard SWC-3
remote coupler
covers 1.8-54 mhz,2 scales 0-200 & 0-2000 watts.
On a scale from 1-10 it is a 7.
There is a faded paint blemish on the top right corner of the metal
case.
No scratches or dings just faded paint blemish.
There was also a resistor replaced inside for the lighting to work.
This meter also has PEP /AVG function feature.
Thus meter will do VHF/UHF if u can find the (opt.) SWC-1 & SWC-2
couplers,I gave up on finding
them.
The meter works excellent & is accurate,has backlighting.
I have the manual,service papers,SWC-3 coupler,& power cord for
backlight & pep function.
Sorry I cant seem to find the box,may have gotten thrown out?
Will pack it very well.
Price is $85.00 + shipping.
Sorry NO COD's
73 de Dennis,tnx fer reading this msg....

Hi, Yes, the rapid charger will charge the batteries when they are not on the radio. They just drop in.

I am very happy with my radio, and would recommend it to anyone looking for a new HT.

http://www.angelfire.com/ca/ke6gwf My Mod page for the TH-G71A.

Talk to you later.
Ben, KE6GWF

Hi Gil:

These may be the same in the TS 830, too, you might check on it.
The counter should certainly be the same, and the PLL is likely
the same. You might have a better chance to find what you need!
Good luck.

2334. TriEx Tower for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-23 00:00:00 UTC
From: cslc82@email.mot.com
Message-ID: <35df72fc.117387854@netnews.worldnet.att.net>
Source record: 134189

TriEx H470 70' tower for sale. This is a 4 section guyed tower, including guy wires, turnbuckles, equalizer plates, rotor plate (drilled for Yaesu and HAM-M) owner's manual, etc. The tower recently lost a guy anchor and was pulled over by the other guywires. It is now on the ground, telescoped to about 20', and is ready for pickup in the Kansas City area. It weighs around 500#. The tower needs a new base plate, and the bottom section legs need to be straightened or sleeved about 3' up from the base. Other than this the tower is in good shape and was recently painted. If you can weld, this tower can easily be salvaged (I don't have welding equipment or those skills). $250, pickup only.
73,
Dan
K0DAN

2335. FS: Icom PCR-1000, Icom R-10 Receivers

Please use the following e-mail address. Apologies for teh wierd spam-filter chars, but I get enough spam already.

Delete the "*"'s.

mw*al*dr*on@*ohi*o.net

For Sale, Icom PCR-1000

This is the computer controlled receiver, full frequency coverage from 10kHz to 1300MHz.
It's a wonderful receiver, fully computer controlled, and beginning to see a flurry of third party support.

$400.00 + Shipping/COD

For Sale, Icom R-10

A top notch handheld receiver, can be fully computer controlled. Full frequency coverage from 500kHz to 1300MHz.
This is an export version, the case has never been opened.
It also included NiCad batteries, as well as the CSR-10 Dos Cloning Software.
This radio is supported by most computer scanning solutions because it utilizes the standard CI-V command set.

$350.00 + Shipping/COD

If someone would like both the above, I will sell them for $700.00, and I will pay for shipping.

If you're wondering why I'm selling, I'm trying to consolidate my radio equipment to generate some extra cash.

I will entertain _reasonable_ offers on the above receivers.

Thanks for your time, Please e-mail me at above address.

-Mike, KB8VKF

I doubt if a standard modem is designed to handle Audio
Frequency-Shift Keying (AFSK) with those mark and space frequencies.
If you're handy, though, you should be able to build a pretty simple
demodulator using phase-locked loops to create the narrow filters.

From: tony@bright.net
Message-ID: <6rsst5$3a2$1@cletus.bright.net>
Source record: 133862

Greetings!

I'm getting ready to install a FT-900 in my 1987 Ford Thunderbird. I will be remote-mounting the faceplate and installing the rig in the trunk.

I am already experiencing an impulse noise problem on the Broadcast Band, and am beginning to ground everything to everything to attempt to eliminate the noise. I will also be installing a new battery (because it's time to do so), new battery cables, and new plug wires.

A buddy suggested I also consider using RG-8 as a power cable, grounding the shield along the run to the trunk. Anyone have experience using coax as power leads?

I would appreciate any other advise offered to help with the noise problem.

Thanks & 73,

Tony N8SNC

Hi,

Mil-spec is short for military specifications. These are simply a set
of minimum standards that the military has for some types of equipment.
This does not mean the equipment is superior to non-spec equipment. Many
manufactures exceed the mil-spec by a wide margin. It does guaranty a
minimum sort of standard. The mil-specs were devised to insure equipment
would be reliable, and rugged enough for field use. As a member of the
military who has used and repaired a fair amount of mil-spec equipment
I can only say, treat it like any other purchase. Call around and see
what the people who use it say.

Message-ID: <MPG.104bdcc2636365f79896cc@news.erols.com>
Source record: 133868

A member of our Amateur Radio club passed away about a week ago, and his family has requested help in disposing of the gear he left behind.

Along with the usual sell-by-the-pound "junque" we all accumulate, there were a few nice items in his shack, that ought to be worth something to the family.

The problem, of course, is finding the right price - one that an interested Ham will be willing to pay, but that won't amount to giving the gear away.

Any help in determining the "right price" for the following list of equipment will be greatly appreciated.

All of the gear listed is in good-to-very good condition, with cables, documentation, etc., and most with original boxes. All of the stuff has been verified as being in working order.

1. Icom IC-271A 2-meter all-mode transceiver
2. Icom R-100C wideband receiver/scanner
3. Radio Shack HTX-100 10-meter transceiver
4. Radio Shack PRO-2035 scanner
5. Yaesu FT-5100 mobile transceiver with remote kit
6. Yaesu FT-51R dual-band HT with ADMS programming kit
7. Yaesu FT-8100 mobile transceiver with remote and ADMS kits
8. Yaesu VX-1R dual-band HT with ADMS programming kit

Thanks for any input. Please feel free to post comments here, but I would appreciate copy by e-mail. If anyone knows of a good reference source for used-gear pricing, a pointer to it would also be appreciated.

Another request: any comments on the overall goodness/badness of any of the older gear listed above (items 1 - 4) would also be helpful. For example, I've not found anyone yet that has any experience with the Icom IC-271A. If it's either a dog or a gem, please let me know.

Thanks for your help!

Bob K9CMR

> Anybody actually did any tests on the SMA-501? How much signal
> strength can I expect to loose?

Recently MFJ started selling an SMA 144/440 flexible whip antenna that's about 6 inches long and works reasonably well, especially outside the ham bands, compared to the stock antenna. It is much more flexible and less bulky compared to the original, and its base diameter is the same size as the SMA connector base on the FT-50. Sells for about $20, so it's also the cheapest SMA antenna out there.

Diamond makes one similar to the MFJ, for more money.

The Comet SMA-503 is more flexible, also about six inches long, but its base is double the diameter of the FT-50's SMA base, so it looks funky, plus it costs more than $35.

The Comet SMA-3 is an excellent performer, and looks good on the FT-50.

The best performing antenna I've used is ADI-Premier model RD-98SMA. This is an extremely flexible rubber-covered piano-wire whip that is 17 inches long, with a small base that just matches the FT-50 SMA connector width. This is the antenna I use most, especially when out in the boonies. Costs about $28.

ADI-Premier is supposed to be selling "any day now" a seven-inch version of this antenna, called the RD-9SMA. This was one I really wanted, but since it has not been made available in spite of being in the catalogs

for six months, I went with the MFJ.

I currently own all the antennas described above except the Diamond and the RD-9SMA.

In my opinion, the combination of the MFJ model and the RD-98SMA is almost ideal. When the small FNB-40 size battery pack and MFJ antenna is installed, the package is only slightly larger than the $80 Alinco DJ-S11/41 micro HTs, but with a lot greater capability.

But the Comet SMA-3 is also a nice antenna, so you can't go too wrong there. Get the Comet SMA-501 only if you need a radiating dummy load.

2375. ATTENTION DRAKE R-8 OWNERS -- GOT THE "BUZZ"

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-24 00:00:00 UTC
From: wb9gkz@aol.com
Message-ID: <1998082414065200.KAA29542@ladder01.news.aol.com>
Source record: 133962

I am curious to see if other Drake R-8, R-8A or R-8B owners have the same problem that I do. My R-8A has an annoying digital "buzz" noise that is wide-band and present on different spreads of frequencies. Most noticable 1.7-2.0 MHz and 25-30 MHz. On some freq's it's strength is S-5! It will increase with the pre-amp on. It is present with all antennas disconnected.

The noise is apparently internally-generated. I believe that it is a product from the design (or lack thereof) of the radio. Does your radio have this annoying problem?

No, it's called ICOM IC-706MKIIG (note the G).

It's ICOM's answer to the FT100.

Was on display in Tokyo at their annual major hamfest recently.

Probably due out about the same time as the FT100.

No other details handy.

Three P200's in the 150s: Includes rapid batteries, charger, antenna and two speaker mics. All on the same frequencies and I can include a list of all the frequencies and PLs programmed on these radios. All in working and good condition, they have a company name and phone number printed on them. Non-negotiable price of $575. Received offers already but they haven't prevailed. Good luck on all your puchases!

Hi Gang,

I have a Drake 2-NT for sale. It works great and looks quite nice,
about a 7.5-8.0 on a scale of 1 to 10. The front panel looks very nice,
the cabinet was repainted but looks nice, and the chassis copper is not
corroded. Includes the original manual. $125.00 + shipping OBO.
Please let me know if you have any questions!

Thanks and 73's

> Do you have attic space? If so you can install an antenna there. Just tack
> it to the rafters. Be sure and use an antenna tuner.

If you do put an antenna in the attic, be aware that it will
almost certainly play merry hell with your alarm system. All of that
lovely RF going into your sensor wires (that almost always run helter
skelter through the attic) make for some very interesting alarm events.
Before I put up my outdoor dipole, I had to power down the alarm and
disable the battery backup before I could transmit.

Hams of Pittsburgh BEWARE!

The ham shop located outside of Pittsburgh, PA known as For Hams Only should
change its name to "for idiots only" as only an idiot would go there twice.

my story starts on Christmas eve 1997. I wanted to make a trade for some ham equipment so I rounded-up my stuff. I took it all in there and got a deal that I thought was fair at the time. Rob, one of the owners, told me
he would order the radio I wanted and fix the hr-2510 all as part of our deal within a week or 2. well, the radio I wanted was a yaesu 8100 dual band and it took him almost 3 months to get one in for me. Every time I called he had a sad story on how yaesu was back-ordered or how UPS lost my
radio. This went on for so long that I figured I almost certainly was ripped-off since this whole deal was on only a handshake, seems rob doesn't
like to put anything down on paper and I didn't make a big deal out of it at
the time. I really don't think I would have ever seen that radio if I hadn't called his business partner at home and asked him to look into it.

my hr-2510 is another story. he told me that there was something really wrong with it. he ordered parts, we waited, he tried to fix it. then he told me that he couldn't fix it and had to send it to uniden to get it repaired. It would be fixed and returned by march 20th. March 20th came and went still there was no call from rob. I heard him on the radio and he
told me he left a message on my tape that my radio had been in. funny, my
answering machine has never malfunctioned before....

So, I went to pick up my radio today and he told me that uniden changes out
the entire board and certifies the radio as completely rebuilt. (again no
supporting paperwork from uniden, no warrantee, etc...) problem is that when
I looked the radio over at home I noticed it wasn't even the same radio I
gave him. the case was scratched-up pretty badly and the front panel and back sticker says hr-2600! Its not even the same radio I brought in! Who

knows where this radio was dug-up and frankly I don't want to know. I called rob and told him that there was some mistake as this is not the same
model I brought in to him. He told me that Uniden probably switched it for
the new 2600 model.

I emailed uniden with the serial number and asked them if there could have
been some kind of mix-up. They said that it came in a 2600 and went out a
repaired 2600 and the serial number matched. When I told this to Rob he said I gave him a 2600 as he didn't have any 2510's in his shop. I should
know what kind of radio I had since I bought it when the 2510 first came out
and had it in every vehicle I owned for the past 12 or so years. Well rob
is going to look into it, he claims, but I haven't heard from him in months.

My advice to anyone in the Pittsburgh area is not to deal with Robert D. Weiss, KE3EE at FHO Communications as he does not keep his word, cannot deliver any promise on time, cannot keep track of customers equipment, and
lies at any opportunity to cover-up his mistakes.

There are hundreds of thousands of specification out there written to
cover everything that can be imagined from communication equipment to
choclate chip cookies and even condoms. These mil specs detail out
every requirement that the product must meet. Each of these reqirement
must be tested and verified on either a sample basis or on every unit
depending on the contract requirements. The mil spec system was a
response to questionable equipment delivered during the late 50s and
60s. This system is being replaced by Acquisistion Reform. The new set
up puts all the control and responsibility back with the manufacture.
The same as it was before the Mil Specs came about. Will this lead to
the same problems all over again? MOST LIKELY.
The mil spec hardware may or may not be any better than commercial
equipment. I have worked on equipment that the manufacture built to the
mil spec requirements and the same equipment built to "Best Commercial
Practices", sometimes the mil spec is better sometimes the commercial is
better. I hoe this sheds some shadows on the idea of MIL SPECs

I have the same radio but not any problems. Have you considered SWR as possible cause? Does the coax have a severe bend anywhere? Have you checked on the true tightness of the head/cable screw? I thought the screw was fastened tight enough but found that it can be - and needs to be - tightened more to remain in good contact with all the contact points it has.

Vic:

Can't help you out with the specifics of operation of the Heath SB-200 but be careful if you are interfacing it with a modern solid state relay/final rig. The SB-200 uses a -135 volt keying voltage and from what I have been told it can be very hard on keying relays in some post mid 1980's rigs.... not to mention possible "hot switching" problems between the relay amp and a solid state keying rig.... especially in qsk.

Nice amps when they work right..... like them all <grin>.

I have the R8B and have had the R8 without the problem you suggest. I do not believe it is a design flaw. The quickest way to see if it is the radio is to go out in the country and run it off 12vdc straight from your car battery. Make sure the car is OFF or you will get all the nice buzzes that your car produces such as airbag, fuel pump, ignition, etc. If the sound goes away in this isolated environment, it is most likely something in your QTH environment, anything from mercury lamps outside, cordless phones, computers, cell phones, etc.

If the sound IS present in the isolated environment, box the radio and send it to Drake. They will find out which component is starting to go out.

Good luck

Bryant

I'm looking at buying a new vertical HF antenna. I currently have a Cushcraft R-7000 and I've had problems with the traps since I bought it. Cushcraft recently sent me some new traps that were supposed to fix some of the problems but I'm still not happy with the antenna. I'm looking at replacing it and would like some recommendations on what to replace it with. I'd like all bands 10-40 and possibly 80 so I'm looking at the GAP Titan and the Butternut HF9V-X9. Anyone who has experiences with these or a recommendation on other antennas I'd really appreciate your input. Please send replies to keith@toolcity.net Thanks and 73.

> Gary

Gary,
Crossband repeating isn't anything new. I was doing it in the early
80's,

This may have been the first "Remote Access" Mobile link/repeater!

In the early 80's, during my employment with Rockwell International, I
build a dual band mobile crossband linking repeater using an Icom 2AT
and 3A. The radios were controlled with a logic board that provided
linking capabilities from 2 meters to 1 1/4 meters. Using an
amplifier,
the trunk mounted system provided 50 watts on 2 meters. From the
drivers
seat, I used a modified speaker/microphone from a Hygain CB radio to
control
the 2 meter rig. The microphone interfaced to a "hump mounted" console

that included a 4X4 DTMF key pad. The standby current drain from the
whole system was about 50 ma.

The IC-2AT was modified by installing a "D" 25 connector on the rear
case.
The logic board (or docking fixture) was mounted in a slim line case
and mated
with the connector on the 2AT. It also interfaced to an Icom IC-3A
through the
external mike and speaker jack. To key up the 2AT, the squelch signal

from
the IC-3A was DC coupled to the to the control logic. The 1 1/4 meter
XMT
was VOX operated. There was also an automatic ID'er, link time out,
and speech
synthesizer chip that read back the 2 meter frequency on the 1 1/4
meter side.
2 meter frequency scanning was also available.

When the IC-2AT's thumb wheel switches were set to 140 MHz, the
synthesizer
BCD lines were switched to a high impedance allowing the docking
fixture to gain
frequency control. When the HT was removed from the fixture, it
regained normal
operation. The up/down and simplex/duplex switches were also
controllable.
Remote frequency control was possible using DTMF tones on the 1 1/4
meter side
or by keying in the same commands from the hump mounted console. I
used a
second IC-3AT as a hand held to communicate back to the link. With 50
watts
on the 2 meter side, the link provided enough output power to work just
about
every repeater in the Chicago area.

I demonstrated the system to Icom at the 1984 Dayton Hamvention. I
even
had offers from other Hams to buy my system but it wasn't for sale. A
few years
later, Icom and others introduced dual band radios with linking
capabilities.

A few years ago I restored the IC-2AT by removing the D25 connector and

replacing the case. Eventually I sold all three hand helds at local
hamfest and
last year my link (the logic board and case) was disassembled and found
it's
way into my junk box. I now own an Icom IC-Z1 hand held and an IC-2700

dual band mobile. The linking capabilies of IC-2700 using the 70
centimeter
band is very similar to my system.

I decided to revive some of the old logic boards to use as a full
dulplex addition
to my Icom 2700. It will use a Hamtronics 440 receiver board and a
diplexer. The
logic unit will interface to the 440 side of the 2700 to key up the
crossband link allowing

full duplex linking capabilities. The 2700 only supports half duplex
through the link.

Date: 1998-08-24 00:00:00 UTC
From: kmortensen@magenta-research.com
Message-ID: <6rsfamhmi1@nnrp1.dejanews.com>
Source record: 133990

Can anyone tell me if Kenwood had a predecesor to TS 600. If so, did was it a cosmetic match to the TS 430 HF rig and associated accessories?

tnx
Keith

I am a very serious collector of early micrcomputers.
There are still some items which I have not been able
to find. I would like to buy these and will pay the following
prices for examples still in their original condition. Will
buy in lesser condition for less money. Please meail me
directly if you have something you wish to sell.

Mark 8 computer - $3000
Scelbi computer - $2500
Altair 680 computer - $1000

Also buying Altair 8800, Imsai 8080 and Sol 20.
and Altair Floppy drive units
and S-100 circuit boards (especially MITS)
and software, literature and docs for the above.

> 300, N, 8, 2 in AFSK (2025/2225 Hz)
> <snip>

1) You need to make a "dummy" telephone coupler to connect (I expect) the audio output of a UHF receiver to the Telephone-Line connection of the modem. Older modems can be direct-connected (possibly needing an attenuator network), but newer modems need "loop current" of about 33mA to make them happy. 3) Set up whatever communications code/ software for appropriate serial port and parameters. 2) The modem must be FORCED to Bell 103A Originate mode to prevent Auto (Non-) Sensing of carrier by sending it an AT initialization string. The AT commands differ from modem to modem; for example, a Diamond SupraExpress 336 needs: AT&F&Q6S37=1N0+MS=B103,0,300,300 4) Start "communications session" by sending to modem: ATA Note: if the carrier is marginal or cuts out occasionally, you may wish to disable "carrier-loss disconnect" by sending modem (before ATA): ATS10=255 -- W.D.A.Geary Wardenclyffe Microtechnology Time flies like an arrow, but fruit files like a banana.

2407. FORSALE(or trade), Best offer, Tinsley Labs classical cass telescope

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-24 00:00:00 UTC
From: jpl@hoserve.ho.lucent.com
Message-ID: <6rshoo$2hl@nntpb.cb.lucent.com>
Source record: 133994
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I MUST sell this asap -- best offer takes this beautiful
classic telescope. An EXCELLENT value for someone who wants
a classic, top quality scope.
Contact me at 732-949-0664 or via e-mail.

Original ad follows:

FORSALE -- TINSLEY LABS CLASSICAL CASSEGRAIN TELESCOPE !!!

I have for sale a Tinsley Labs 8-inch Classical Cassegrain
telescope, complete with the original German equitorial
mount and clock drive. Tinsley produced these fine scopes
in the mid 1960s and are known for their fine optical and
mechanical properties. They were (are) research quality
instruments which are quite rare and retain their value.

In mint shape, they go for around $3000. The one that
I have is in very good condition, but needs a few minor
items to bring it to "mint", as follows:

- mirrors are excellent, no scratches or chips, and
bright. Although very good and workable, a
recoating would make them mint.

- clock drive needs an external 12V battery pack and
rheostat to make it operational (this is as it was
intended). A nicad pack or motorcycle battery would
be appropriate.

- A low tripod or pedestal base (about 20" high) and
"rocker box" is needed for the equitorial mount to
sit on.

- the optical tube has some scratches in the paint and
a small dent, which absolutely does NOT interfere with
the optical path. Paint scheme is the original Tinsley
gray.

Thats about it. I just don't have the time to use this
scope and it's too valuable to just let it lay idle.

I'm was asking $2150. for scope and mount (and absolutely will
NOT sell them separately) but am open to offers. Please, I must
find a good home for this; make a bid!

The equipment is located in Monmouth County, NJ. For
further information, please contact me.

Thanks,

Joe Levantino
Lucent Technologies - Bell Laboratories
732-949-0664 (days)
jlevantino@lucent.com

PS -- I will consider a trade for equally valued Amateur
Radio Equipment, in particular a high quality, heavy
duty, HF linear amplifier (Ten-tec, etc).

2412. Re: Need quick instructions for SB-200

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-24 00:00:00 UTC
From: martyt@pobox.com
Message-ID: <35e2d0bb.30993576@news.supernews.net>
Source record: 133999

On Mon, 24 Aug 1998 13:36:33 GMT, pmb1010@hotmail.com wrote:

>Our ham club is being lent an SB200 for our club station,
>but the lender does not have instruction manual.
>(He runs QRP all the time).

Contact Ray Sarrio (www.sarrio.com) and buy a copy of the SB-200 manual. But be aware that the operating instructions are about two paragraphs long.

>I don't run an amp either. Never had the need... So can
>anybody post a short instruction list on the "how to"
>to do a setup & tune for this amplifier, please?

First, if you don't know what you're doing, it'll take no time at all to render the tubes in the amp worthless (hint: if the tubes start glowing bright red inside, that's a bad thing...). If it was your amp, you wouldn't feel nearly as bad as when it's a borrowed one...

As others have pointed out, make sure the keying interface is compatible with the exciter - also the ALC voltage is likely to be incompatible with most newer rigs; don't worry about ALC though - just leave it unattached...

With that out of the way, here's how I tune my amp... (going by memory on the names of the knobs - I'm sure I'll get corrected if I screw up the names... The knob positions are correct, though...)

0. Turn on the amp and exciter and tune to the desired frequency. Make sure the antenna system is tuned properly (under 2:1 SWR).
1. Set bandswitch to the desired band (right-most big knob) and tune capacitor (middle big knob) to center of desired band. Set load capacitor (left big knob) at about 4.
2. Reduce drive (power output) on exciter to 0 (CW mode)
3. Set meter switch on SB-200 to read Plate current
4. Key exciter and increase power to show about 200 ma plate current.
5. Adjust tune capacitor for minimum plate current
6. Adjust load capacitor for maximum power out (you need a SWR / Power meter between the amp and antenna tuner (or feedline to the antenna if no tuner is used)).
7. Repeat steps 5 and 6, increasing exciter power as you go - it takes maybe 2 or 3 steps until you get to max exciter power. Allow 30 seconds cooldown time between adjustments. You may need to repeat 5 and 6 a few times even after you get to max exciter power as changes in the tune capacitor cause changes in the load capacitor and vice versa. Eventualy you'll hit the magic spot.

8. Change the meter switch to read grid current, and verify it's within the white band (less than 500ma) when transmitting at full power. If it's over 500, reduce exciter output power.

Expect to see 500 to 600 watts output from the SB-200 with good tubes.

>Just need a 1-pager to place in plastic near the amp
>so someone can figure out how to operate in the correct
>manner without burning it up...

As I said above, I'd be real nervous about having someone who's never used an amp try to tune it up without someone more experienced there to oversee the operation and make sure it's done right. Tubes aren't cheap (fortunately, the 572Bs in the SB-200 are cheaper than most)... I'd suggest you have a club meeting or some other orientation for the people who don't know what they're doing - the ones who do know what they're doing won't need your instruction sheet anyway...

73,

-Marty KI0LO

Cross-posted to: rec.radio.swap,alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment

Includes rapid battery, antenna and charger for each radio. I'll even include two speaker mics. A fixed price of $575 includes shipping(US ONLY). AND, I'll throw in a useless to me PRE-AMP for 150-160MHz which I don't even know if it works because I don't know know to install it. Also, these radios say One Sound on them who was the original owner. You will notice my prices for these radios are cheaper than any of the dealers on the newsgroups. Good luck to all on the endless quest for bargains!

2418. Help with old radio direction finder for physics project

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-24 00:00:00 UTC
From: Jason Powell <fizzx@wi.net?delete_the_?>
Message-ID: <6rsog0$8o0$5@news.inc.net>
Source record: 134005

Sorry if this message is not related to the purpose of this newgroup.
I'm trying to get information for a high school advanced physics project.

Before school starts I decided to throw away a bunch of junk that's been in
our old storage area for perhaps decades. Way
back in a corner piled over with junk I find, much to my surprise, a radio
direction finder with instruction manual.

Here's the specs:

Sanfreshin Digital Direction Finder MDL RDF-501D

3 bands, Super-Hetrodyne system w/1 RF amp.,stage

Freq - Beacon: 175KHz-400KHz, Broadcast: 535KHz-1605KHz, Marine:
1600KHz-3999KHz

Sensitivity- Beacon: 45 microV/m 50mW, Broadcast: 30microV/m 50mW, Marine:
30microV/m 50mW

Antenna: rotating bearing antenna, vertical sense antenna

Noise ratio: 20db

Selectivity: 30db/10KHz

IF: 455KHz

BFO: mod freq, approx 500-800Hz

Output: 400mW

And it runs on 4 D cells.

I slapped in batteries and it works! Or at least it came on. Although
designed for marine navigation, I'm hoping I might be able to use it to
track high power rockets (find where the heck it landed). Heck, the manual
has a little section on Homing (tune in to transmitters freq, steer the boat
so that the null is kept on the meter).

Now the question is are there transmitters that will fit in a rocket and
broadcast at the freq the unit picks up?
Can high school students with little electronics skill build one? If so,
what do we need to get and how do we put it together?

PLEASE RESPOND VIA EMAIL as I just subscribed to about 20 radio newsgroups
and can't possibly scan each one :-)

> a trade. The value of the radio is around $750 ... William Lee

William:

I bought my Ten Tec Corsair II sevarla months ago for just over $400.
and then saw them posted for less than that with filters and the matching
power supply (mine had neither), has something happened that has escalated
the used value by over $300.?

I would have loved to have gotten $750. in trade value out of mine! I
heard that collectors inflation is puffing prices, but I didn't know the
Corsair II had become a collectable. :-(

From: Jim <jsides@flash.net>
Message-ID: <35E10119.638E@flash.net>
Source record: 134049

I read in an article somewhere (73 Mag ??) that the output
was around 2-5 mW. It probally varies from one unit to another.
Thats really pretty strong if true !! I have an ICOM W21AT "HT"
that goes down to 15mW and I have NO PROBLEM bringing up several
repeaters in my area (anywhere from 3 -5 miles away) using the
little "Rubber Duck" antenna that came with the HT, while sitting
in my living room no less !! In the car, using a small mobile mag
mount ant., the 15mw setting gets me into many local repeaters 5-10
miles away (depending on the repeater's ant. height on course).

The bottom line, it doesn't take much !!

Cross-posted to: rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.swap,alt.music-lover.audiophile.hardware

Hi folks :) I'm an electronic musician *seriously* looking for the following musical equipment, in any condition, even broken:

-OLD SYNTHESIZERS from the 60's-80's Moog, ARP, Oberheim, etc

-OLD KEYBOARDS w/ knobs or sliders Roland, Korg, Sequential, etc

-OLD DRUM MACHINES w/ terribly electronic sounds :)

-OLD SEQUENCERs w/ knobs for each step

-OLD VOCODERs for that "robot-voice" sound

-MODULAR PATCHABLE SYNTHESIZER GEAR, complete systems or individual modules - "Switched on Bach Moog", ARP 2600, Paia, anything similar.

-RACK SYNTHS, INTERESTING EFFECTS and anything related to the above.

-Moog, ARP, Korg, Roland, Sequential Circuits, Oberheim, Yamaha, EML, Electrocomp, EMS, Synthi, Putney (VCS3), RSF, Buchla, Serge, Polyfusion, Ionic, Paia, SMS, Wavemaker, E-mu, Steiner-Parker, Chroma, Aries, etc.

-Roland TB-303 Bassline

-Roland TR-909 Drum Machine

-Roland TR-808 Drum Machine
-Roland TR-606 Drumatix
-Roland CompuRhythm

-Simmons SDS-7 + SDS-5 + SDS-6 Drum Brains and Sequencer

-Pearl SY-1 Syncussion

-E-mu SP-1200 Sampler Drum Machine
-Sequential Studio 440 Sampling Drum Machine

-Sequential Prophet VS rack
-Oberheim Xpander
-ARP 2600
-Korg MS-20/50

If you have any of the above OR SIMILAR for sale or know someone who might, please email me at rolandman1@aol.com

and include phone number as well if you'd like.

I'm also looking for old literature on electronic music as well: product brochures, books, old magazines, etc.

Thanks in advance and apologies if this post annoys anyone.

Hi to everybody !!
I would like to acquire data from a weather radiosonde that it
transmits on
404 MHz whit the following communication parameter: 300, N, 8, 2
in AFSK (2025/2225 Hz)
(but I can make some adjustement in tones on the trasmitter)
I have tried to use a modem, but without result ;it seems it cannot work
without the phone line signal and a remote modem. Can I start data
acquisition before the carrier detection and handshake process ?
. I have thought to use the Sound Blaster, too, but I have found no
programs
supporting the communication parameters that interest to me.
Is there any software I can use ?. In alternative, a TNC could work?
Thanks in advances

But then, how much mobile 440 MHz SSB were you going to work?

I use my MkII on HF only; replaced the TS-50 because I needed the
remoting capability.

Seems like stuffing all those bands into one rig does create
compromises.

Source record: 133813

I had an 847 for about 4 months before trading it in for a 920. Here are my impressions:

As a VHF, UHF rig or satellite rig, it's wonderful. If you don't mind the smallish controls you will love it. On the other hand, I thought it was not a very good HF rig at all. It's AGC has problems with strong adjacent signals and I basically found its DSP on CW to be useless. Anyone who does a lot of HF CW work should compare its DSP to that of the 920 (which btw is currently available at a lower price than the 847).

Rick,
I've been reliably informed by a switched on amp tech out your way that
the TE System amp's, like many others leave a lot to be desired in the
bias design department.
Make of that what you will.

> Thanks in advances

Try a "packet modem" TNC, particularly the "Baycomm" type.

They are based on a "modem" chip (TI TCM3105) that is compatible
with the modem FSK specs. By jumpering a few pins, you can change
the receive tone pairs. Search for "Baycomm modem schematic".
Note that the Baycomm modem data is sent through the handshaking
pins, and not the RX/TX pins of the serial interface. You will
need to rewire the connector.

Or, look for two shareware programs called "Hamcomm" and
"Radioraft". They can be set for custom mark-space freqs, shifts
and baudrates. They both require the "Hamcomm" interface - the
same one used for MDT, Trunker, POSCAG, etc, etc. The circuit is
included in the doc's.

Good Luck!

ANLI makes good antennas. I think they are Premier but could be wrong.
Yes, I think they compare very favorably to Comet and say, Diamond.
Performance would be all about the same but quality would change with
different brands and I think ANLI is right up there with the best. I have
also found Pro AM (Valor) and MFJ to be good. One of my favorites is the
MFJ 1717 dual bander 12" long and flexible. This antenna with a homemade
"tiger tail" hears and gets out better than any antenna For the HT that I
have. The very best for getting out are the collapsible 39" half waves but
they place quite a strain on the old bnc joint. Take a 12 or 14 " piece of
just about any wire and trim back one end and smash it under the bnc and
let it hang down for a counterpoise. Adds about 2 S units on receive for
those weak stations.

2463. Using The Heath QSK Board & Pin Diode Specs

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bdcfc8$2e4c40c0$6c8a92d0@davidc.bit-net.com>
Source record: 133880
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Would the SBA-2001-1 QSK board manufactured by Heath for their SB-1000 work with the early SB-2xx series? (it was factory assembled and I think also used by Ameritron)

The one I have was modified with IN4007 diodes in place of the pin diodes (which I believe were MA4PH301's), what cautions are in order to be sure it will still perform safely with the SB-2xx series amps (assuming it will work with them at all)?

BTW: Anyone have the specs for the MA4PH301 device? I'd like to compare them closely to the IN4007. I am particularly interested if there is a significant capacitance effect due to the substitution within the 1.8-30MHz range of operation.

Thanks & 73, DavidC AA1FA--

Hello Alan,
I have been using a SGC-230 tuner since Oct 94 and have no
complaints. The tuner is mounted at the base of a homemade
40ft vertical, elevated radials droop from the tuners rooftop
location. Added some rtv sealant to the 230's case, after
3 winters it keeps going....
It tunes reliably 80 thru 10 meters, and some narrow segments
on 160 mtrs. I'm into the digital modes and cw.
For portable HF operating in Alaska's bush, I use an Alinco
EDX-2. The edx-2 will work with other brands of hf radios
provided you make up a control cable. I manually activate
the tuning cycle on mine, currently using a FT-890 and a kam+
with it. Lacks the "plug and play" ease of the SGC line, hi!
Curious as well about the Icom AH-4, if it could be utilized
with any brand of hf rig. When things break in the bush, we
improvise.

I have for sale a Cherokee AH-50 5watt 6 meter HT. It is a great
little radio to have mobile or to carry while hiking etc. Has 12V 600mAh
NiCD battery and Wall charger. Box and Manul, and all paper work. This HT
is only about 6 months old or less! I have no use for it now with a bigger
rig to use on 6 meters. It is in GREAT shape. One small scratch (well,
it is about 1/8" or shorter) on the battery. That is it!! Great HT for
summer/fall 6 meter DX!!! I have worked about 5-10 states on an external
antenna! If you are interested I'll let it all go for $125 if you send
a Money Order or check. If you want to do COD I'll do that for $130. Please
let me know if anyone is interested. thanks....

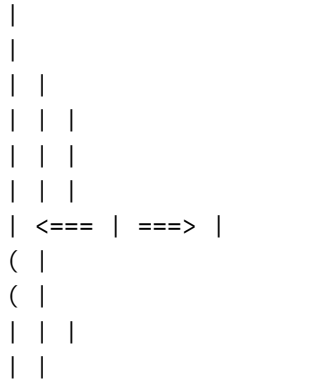
> many dual band antenna have the antenna coiled in the middle of the
> antenna. Is this really necessary?

Well, *something* like it is necessary. In order for the antenna to
resonate on both frequencies, there has to be some sort of loading coil in
it. Sometimes you'll see this as a coil in the antenna itself, other
times you'll see a little "bulge" or "insert" in the middle, which
contains essentially a little coil.

The coil represents a little LC circuit, which is frequency-dependent.
For example, at 440 MHz the coil in the middle may look like a high impedance.
This will electrically separate the two parts of the antenna, above and below
the coil, making it appear as two shorter (higher-frequency) attennas. Yet,
for the same antenna operated at a lower fequency, eg. 144 MHz, the coil may
act like a low impedance, and the antenna behaves as one continuous length,
which is the electrical length of the two parts plus coil.



Note that I draw the high/low freq examples longer than the physical
antenna, because their electrical length can actually be greater than their
physical length.

>G7obr
Hi,

You are opening a can of worms here......

For what its worth (I got mine ten days ago):
It's a superior VHF/UHF radio, far ahead of the 736 in terms of
sensitivity and IMD.
If you want to use it on very crowded bands (like HF) you'll
definitely want to buy the add-on mechanical filter (I have ordered
one)
You'll get glowing modulation reports, it sounds wonderful, in receive
and transmit.
The fan is annoying, I have reduced the noise by reducing the speed
(and air volume), by putting a 100 ohm resitor in series with the rear
fan (thats the one that works continuosly).

If you can live with its (few) shortcomings, and wont miss a VOX, go
get one, no RUN

(No connection with Yaesu - in fact its my first Yaesu radio ever)

2492. F.S. Mirage BD-35 Dualband Amp for Ht (or tired mobile)

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: n0oba@aol.com
Message-ID: <1998082512025400.IAA09982@ladder01.news.aol.com>
Source record: 133909

Mirage BD-35 is a 45+ on 2m and 35 on 440. Accepts .3watts to 7 watts.
2-2.5watts drives amp to full power. 7watts I was able to get 58watts. Only 3
months old. I use it with my C510 mini HT with the mobile adapter. I almost
never used it. I also used it with my ft530 at times but mainly the C510.
Maybe 20 hours on this thing and that's pushin it. Asking $105 shipped.
Thanks, Scott,n0oba

> flawlessly on high power with its standard battery and antenna.

Exactly. I went through 1 of them already. When I bought mine, I was
getting err2 4 out of 5 times. The radio was returned and I got another
one.

Our hobby is and can be very expensive. We don't need some in-experienced
Tom, Dick & Harry telling us to use the radio at low power. There are
some flaws with the design, and they should replace the radio.

My err2 problems have disapeared. Now I have another problem, constant
hissing/wind sounds during RX/TX. Back the radio goes .. :)

> usually hear a repeater much further than you can work it with a HT.
> Again the remote base needs an automatic time out timer.
>
> Gary

Gary,
Crossband repeating isn't anything new. I was doing it in the early
80's,

This may have been the first "Remote Access" Mobile link/repeater!

In the early 80's, during my employment with Rockwell International, I
build a dual band mobile crossband linking repeater using an Icom 2AT
and 3A. The radios were controlled with a logic board that provided
linking capabilities from 2 meters to 1 1/4 meters. Using an
amplifier,
the trunk mounted system provided 50 watts on 2 meters. From the
drivers seat, I used a modified speaker/microphone from a Hygain CB
radio to
control the 2 meter rig. The microphone interfaced to a "hump mounted"
console

that included a 4X4 DTMF key pad. The standby current drain from the
whole system was about 50 ma. The IC-2AT was modified by installing a

"D" 25 connector on the rear case. The logic board (or docking fixture)
was
mounted in a slim line case and mated with the connector on the 2AT.
It also

interfaced to an Icom IC-3A through the external mike and speaker jack.

To key up the 2AT, the squelch signal from the IC-3A was DC coupled to the to the control logic. The 1 1/4 meter XMT was VOX operated. There was also an automatic ID'er, link time out, and speech synthesizer chip that
read back the 2 meter frequency on the 1 1/4 meter side. 2 meter frequency
scanning was also available.

When the IC-2AT's thumb wheel switches were set to 140 MHz, the synthesizer BCD lines were switched to a high impedance allowing the docking
fixture to gain frequency control. When the HT was removed from the fixture, it
regained normal operation. The up/down and simplex/duplex switches were also
controllable. Remote frequency control was possible using DTMF tones on the 1 1/4
meter side or by keying in the same commands from the hump mounted console. I
used a second IC-3AT as a hand held to communicate back to the link. With 50
watts on the 2 meter side, the link provided enough output power to work just
about every repeater in the Chicago area.

I demonstrated the system to Icom at the 1984 Dayton Hamvention. I even had offers from other Hams to buy my system but it wasn't for sale. A
few years later, Icom and others introduced dual band radios with linking
capabilities.

A few years ago I restored the IC-2AT by removing the D25 connector and

replacing the case. Eventually I sold all three hand helds at local hamfest and
last year my link (the logic board and case) was disassembled and found

it's way into my junk box. I now own an Icom IC-Z1 hand held and an IC-2700
dual band mobile. The linking capabilies of IC-2700 using the 70 centimeter
band is very similar to my system.

I decided to revive some of the old logic boards to use as a full dulplex addition
to my Icom 2700. It will use a Hamtronics 440 receiver board and a diplexer.
The logic unit will interface to the 440 side of the 2700 to key up the crossband

link allowing full duplex linking capabilities. The 2700 only supports
half duplex
through the link.

Icom IC-821H Dual Band Sattelite Xcvr, covers 2M & 70 CM. This is Icom's top of the line sattelite rig and works great as a base station too. In mint condition, and complete with blank warranty card, all original docs and packaging. Only $1000 OBO Shipped.

Astron RS-20A Power Supply, 25A rated in perfect condition. Like New! $75, will split freight.

BC-601 rapid smart desk charger, and two Icom BP-173 battery packs. These packs were used as reserve spares, and have been used only one time. A complete accessory setup for someone, and priced at only $100 shipped CONUS.

Larsen Dual Band NMO 2/70 mobile antenna, including trunk lip mount, coax. Add a PL-259 and you're ready to go. Used only a few months, perfect working condition, no damage of any sort. $35 shipped CONUS.

MFJ extended rubber duck for dual-band HT. Full quarter wave on 2 meters for enhanced performance. Like new and fully functional. Only $12.50 shipped CONUS.

MFJ-1750 5/8 wave 2 meter ground plane antenna. This is NEW and is in UNOPENED original box. Cheapest good antenna you can get anywhere. Pay me $20 (list price) and I'll ship it ***FREE*** in the lower 48, and no tax either!

JPS NIR-10 DSP in good condition with box and docs. $80 shipped CONUS.

Icom HM-54 Speaker/Mic for IC-W32A HT, excellent $45 Shipped.

Icom HM-46A Speaker/Mic for IC-W32A HT, excellent $45 Shipped.

MFJ-8621 Packet Tranceiver, works fine as a packet rig on it's stock freq of 145.01. Unit is in mint condition, working perfectly, with original docs and box, $60 shipped CONUS.

Diamond SX-200 VHF Wattmeter and SWR Bridge, in as-new condition with original docs and box. $50 shipped CONUS.

The Legal Stuff:
Terms are postal M.O. prepayment, I'll supply phone # and references if requested. Shipment will be via Priority Mail for small items, UPS ground for radios and expensive items. All shipping is included EXCEPT where noted.

Thanks and 73,
Ron Ricketts WA5VFA

I need information about old Alinco radio /DJ-100TC/?
This was a gift, but don't have any instructions with it. The unit is powered with NiCad battery 7,2V and have external power supply - 13,2V. I don't know how much power is it? I found it in one older catalog and they said that it's 6 Watt power output with external power supply.
Please help me if you could!?

My ICQ UIN is 2239654 or email on Boyan_Marinkov@yahoo.com .

2501. HF Mobile Noise - Coax For Power Lead?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: tony@bright.net
Message-ID: <6ruk7l$q8c$1@cletus.bright.net>
Source record: 133918

Greetings!

I'm getting ready to install a FT-900 in my 1987 Ford Thunderbird. I will be remote-mounting the faceplate and installing the rig in the trunk.

I am already experiencing an impulse noise problem on the Broadcast Band, and am beginning to ground everything to everything to attempt to eliminate the noise. I will also be installing a new battery (because it's time to do so), new battery cables, and new plug wires.

A buddy suggested I also consider using RG-8 as a power cable, grounding the shield along the run to the trunk. Anyone have experience using coax as power leads?

I would appreciate any other advise offered to help with the noise problem.

Thanks & 73,

Tony N8SNC

From: Jim <amcastmis@earthlink.net>
Message-ID: <35E2F143.D3E0CE17@earthlink.net>
Source record: 133922

Hi Steve,

I have a DX-70T which, except for the lower output on 6 meters is the same radio as the TH. It's a pretty decent radio for the money. A hot little receiver but limited on any filtering options. A fair amount of features but not lot's of bells & whistles. If 10 & 6 meter FM is your thing, you probably won't like the Alinco. The tone settings are under the radio via dip switches so unless you only access 1 repeater, it's pretty useless. I have no idea how the 706 handles there settings. Also, if you're thinking of the 706, you might want to wait for the new MKII(G) that's going to have 440 also. I've worked plenty of DX on my DX-70 when it's doing it's role as a backup radio. I've used it in the truck some but not too much. Seems to work ok mobile but since I'm not a big mobile operator maybe others can give a better answer. One of my neighbors that uses a TS-50 was in the truck once and said my Alinco was quieter than his TS-50 for what that's worth. Alinco's, like most radios, are pretty soft on the used market so you could get a good deal I'm sure. 706 MKII's are now under a grand new since they want to unload them before the G model comes out.

Good luck on your decision.

>relatively simple, way to tie in to the battery?

While I am not familiar with that particular vehicle, I have an
appreciation for your problem.

The ways I have run battery leads through the firewall are:

1. If an existing feedthrough boot allows it, simply slip the wires
through with the existing bundles. (I know, you already said this
wasn't possible). Sometimes you CAN do this with a bit of lubricant
(teflon or silicone grease) and some stiff tinned cable ends.

2. Many vehicles have an oversized hole in the firewall and use a
grommet that has quite a bit of rubber beween the actual wire bundle
and the edge of the firewall hole. In this case, I have used an awl
or punch to pierce through the edge-rubber then push the power wires
through. These holes will tend to self-seal around the wire, or can
be sealed with RTV after installation.

I will heavily tin the ends of the wires to make them stiff enough to
shoved through the pierced holes.

3. If all else fails, I look for rubber drain plugs under the carpet
and pierce those to get out of the passenger compartment. Not all
drain plugs lead to an area good enough to use for power wires,
though. These are a LAST resort in my experience.

4. See if you can easily remove the glove box... many times you will
find additional possibilities here, and these are usually easier to
remove than any other part of the dashboard. Of course, a
passenger-side airbag may make this option impossible.

There have been times that an automotive installation took me 6-8
hours because I took my time and did the in-car research regarding
possible paths for all the wiring (antenna, power, audio, control
cables, etc.). Sometimes it takes as long to develop a good grounding
system as it does to route cables in these modern "plastic"

automobiles!

It is ALWAYS possible... sometimes it just takes a lot of experimentation. Look at it as a challenge, not a problem or you might regret a hastily-made choice down the road! Always err on the side of safety and don't forget the proper fusing (both inside the engine compartment and inside the passenger compartment)!

Good Luck,

Steve

2514. IC-706 MKII G its for real -Read and Weep

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: AB2ET@my-dejanews.com
Message-ID: <6rv8f1$22j$1@nnrp1.dejanews.com>
Source record: 133931

Well gang it looks like ICOM has done it to us again, just after getting a IC707 MKII and may be if the ship makes port, getting the DSP addon by DECEMBER A good contact in Japan has sent me the following URL http://www.icom.co.jp/show/jaia/vol26/mk2g.html. And YES its the NEW and Improved and it slices and dices its the ICOM IC-706 MarkII G with 'You Guesse it" 1.9 mhz-430 Mhz to bad I am not abel to read the Kanji but the specs are in English. Read a weep, It looks like ICOM will not provide any upgrade path for existing MarkII owners just like the Mark I gang was left in the lurch. Now it makes perfect sence as to why the Mark II aftermarket is down to the $700 $800 range. I looks like it is no longer RIGHT to expect at least one year before the depreciation on ICOM Rigs hits the dumps

73,

Steve

Source record: 133932

Is there any shareware/software available for use with the Kenwood TS-520?

Mike

2516. FORDs - HF QRN, the fix

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: Sandy Lynch <slay@netcom.com>
Message-ID: <slayEy9E4M.B3s@netcom.com>
Source record: 133933

I've previously asked for help on getting rid of some QRN in my
Ford Explorer which has made HF mobile operation none to pleasant.
Many have offered very helpful comments and advice ... and this
posting is to provide what additional info I may have to help
others in similar situations.

After installing an HF rig in my 97 Ford Explorer, I was disheartened to
discover a S9+ noise level. The source appears to be the electric fuel
pump. I received some excellent info from other Ford owners and I now
wish to pass along some of that advice here.

Ref: Ford Technical Service Bulletin: 98-7-3
"Fuel system - fuel pump: whining/buzzing noise comes thru 2-way radio
speakers"

Vehicles covered:

Ford
1990-93 Tempo
1990-97 Probe, Thunderbird
1990-98 Escort, Taurus
1990-99 Crown Victoria, Mustang
1997-98 Contour

Lincoln-Mercury
1990-92 Mark VII
1990-93 Topaz
1990-96 Continental
1990-97 Cougar
1990-98 Sable, Town Car
1990-99 Grand Marquis
1991-98 Tracer
1997-98 Mystique
1997-98 Mark VIII

Light Truck
1990 Bronco II
1990-96 Bronco
1990-97 Aerostar, F Super Duty, F-250 HD, F-350
1990-98 Econoline
1990-99 F-150, F-250 LD, Ranger
1991-98 Explorer
1993-98 Villager
1997-98 Expedition, Mountaineer, Windstar

1998 Navigator

The Problem:
Electrical noise on radio speakers caused by in-tank electric fuel pump.

The Fix:
Installaition of an RFI filter (Part No. F1PZ-18B925-A) on the fuel pump inside the fuel tank. *Note: some light trucks may require one RFI on each fuel pump on multi-tank vehicles.

Test Procedure:
Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise variee, or the noise comes and goes with vehicle speed, then it is NOT the fuel pump, and this fix will not be effective. Use the following procedure to determine if the fuel pump is the cause of the radio noise.

1. Turn the radio on.
2. Turn the ignition key to the RUN position, but do NOT start the engine.
3. The fuel pump should run for about 1 second with the key in the RUN position with the engine not running. Listen for noise in the radio. If the noise is present while the pump is running, and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

Additional comments:
I purchased by own vehicle "used" from a Ford dealer and also purchased the extended service plan. However, the service manager told me that this repair would be done under the BASIC WARRANTY and not by the extended service plan. For what it's worth, the RFI part costs about $70 and sometimes takes a week or so to be delivered to the dealership. Other Ford owners have also told me that this fix was done at no charge to them as well. So.... if you've got a problem ... perhaps this will help.

Warmest 73,
Sandy W7BX

2517. Re: FT920 PLL Unlock

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: Wayne Perzan <k1muc@gis.net.nospam>
Message-ID: <6rv2fpgnn1@supernews.com>
Source record: 133934

First FT-920 that I have heard with this type of problem, but check
http://www.wm7d.net/hamradio/ft920.html for other's experience.
Also, be sure to try the microprocessor reset procedures at the back of the Operating Manual before ever sending an FT-920 for
repair.

My own and three others I know of are fine, but one had to go back for problem with some sort of full 120 Watt CW output in all
modes that somehow involved the antenna tuner. It may have got stuck in auto tune mode. He was fortunate that it cost him nothing,
only two trips to HRO in NH from south of Boston. Yaesu upgraded the antenna tuner and did a full alignment so the radio seems to
have been improved in RF emission products than before (he is about a mile away and we both use 6 Meters). The same owner later had
another problem after a thunderstorm that required a microprocessor reset procedure. He had forgotten that it could be all that was
needed and was ready to send it back again.

I once fixed an FT-680S with an intermittent PLL problem that went back to Kenwood three times without success. It had an
incompletely wave soldered surface mount resistor - very hard to find. Took exhaustive freezing and warming cycles to even reproduce
the problem, apparently beyond Kenwood's expertise.

2520. Re: FT847 are they any good (do i buy one)

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: hasan schiers <schiers@netins.net>
Message-ID: <6rv4i8$v49$1@ins8.netins.net>
Source record: 133937

If you are interested in 6/2m and 70cm as well as satellite work, you will love it. Excellent sensitivity and far superior performance in every aspect over the 736. No vox...I don't use it. CW semi-breakin works fine. I put both Collins mechanical filters in it and am well pleased. It's dsp noise reduction is excellent...far better than my Kenwood TS-870s...however, the rest of the 870s's dsp functions are better than the 847.
(Variable width filtering, notch, etc)

If I could only have one radio the 847 would be it because of its versatility and overall quality. I would not buy it if I were an HF contester, or had little or no interest in VHF/UHF/Satellites.

It is one of the best purchases I have made in years, even with its few warts. 73,

2522. Siltronix 1011C TUneup question

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: kirkwood@seacorp.com
Message-ID: <35e317e4.112060033@paperboy.ids.net>
Source record: 133939

Can someone explain why the tuneup procedures for the 1011C cann for adjustment of the preselector, tune and load caps while transmitting, and then calls for adjustment of the same caps in receive. I would think that re-adjusting these caps in receive mode would disrupt the transmit tuning.

My first guess is that the rig needs to be re-aligned if there is too big a discrepancy between the transimt and receive cap positions, but the operations and maintenance manual does not go into any details about this.

Any thoughts?

aj

Tony:
I have used RG/8 in several vehicles and it works
fine. The impulse noise problem in the AM band sounds
like on board electronics. See what happens when you
install all new ignition wiring. IF this doesn't cure the problem
then some good grounding is in order.

Does anyone know of a better belt clip for the Q7A. The stock one has to be the worst one I have ever seen.There must be something better. It makes the radio almost twice as thick. Surely one could be made from spring steel. I hear they came up with a better one for the Yaesu VX-1R.

430 MHz sucks. SSB guys won't buyit if it don't goto 432+.
There's reference on the page to something about 430-440, but that's not high
enough
for FM.
Would be pretty stupid to market a USA version that doesn't go to 450.

Anybody wanna sell their mk1 or 2 cheap?
miker

In all likelyhood, using coax for a power lead is a waste of time.
Impulse noise is probably being received at the antenna. Only way to
effectively deal with it is to locate the source and eliminate it. Engine
tuneup, plugs, resistor wires, engine bonding to ground, hood bonded to
ground, etc.

2534. Diamond SRH519 HT Antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: Jeff <jeffj@scott.net>
Message-ID: <PNR683651913i@scott.net>
Source record: 133951

I purchased a Diamond SRH519 dual band HT antenna from HRO sometime ago and when I first received it, it had an internal short and would not transmit or receive. I sent it back to HRO and they replaced it with another, which worked for about a week, then developed the same problem. I was frustrated so I just threw it in my desk drawer. Now I would like to try and fix it for my brother who needs an antenna for his FT50. Does anyone know how to take this antenna apart? It has an SMA mount and after studying the base carefully I still can't figure out how to take it apart. Thanks for any/all help!

2535. WTB: Programming hardware for Yaesu/Vertex portable

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-25 00:00:00 UTC
From: Dan <n7wpd@inconnect.com>
Message-ID: <6rvje3gir1@news.inconnect.com>
Source record: 133952
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.swap,alt.ham-radio.marketplace,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur

Hi All,

I have just spent over an hour making at least a half dozen calls across the country. You'd think that in that amount of time i'd be able to find a company willing to sell me the VPL-1D programming kit for the FTH series portables and the VXR series repeaters. Most of the companies that I spoke with said that they can sell this kit to adresses in their own state or export only. I have been unable to speak with the Yaesu rep. that covers Utah(based in Denver, go figure?).

I have 12 of the FTH-2009 radios and I need the programming cable and software. Anybody have pinouots for the cable? Can anybody help me out?

After today, I am of the belief that Yaesu software is harder to obtain than Motorola RSS.

Thanks in advance!!

Dan Dialogue

Miker,
The Icom 706Mk2G will cover 430-450 in the USA version. Not to worry-
Icom will likely throw the different firmware into the "A" versions
which are destined for North America.

Remember, the photo and specs on the Icom Japan web page are for Japan.
Japan's 70cm allocation is 430-440. Just as their 2M allocation is
144-146.

I have the DX-70T. The difference being the 100 watt output for 6 meters.
All
other features are the same.

I was able to compare the two radios at a hamfest and chose the DX-70. I did
not choose it because it is better than the 706. I think the 706 is more radio
than
the DX-70 -- it is also more expensive, although the Yeasu threat seems to be
driving the price down.

I chose the DX-70 for mobile use. I wanted a radio that is easy to use while
travelling down the road, either high-speed interstate or twisty back roads.
While the 706 is more radio, it also has a busier faceplate. Too many little
buttons for my klutzy fingers. The Alinco has a cleaner and easier to use
face plate.

I did not need all the bands in one radio like to 706 provides. I haven't even

hooked 6 meters up yet. I have 2meters & 70cm on another radio. I can
monitor all three (hf/vhf/uhf) while traveling. I don't know if you can do
that
with the 706. If you don't have the high bands already, the 706 may be the way

to go.

The DX-70 isn't perfect. If you are going to work a lot of 6 meter repeaters,
don't rely on the DX-70. CTSS tones are set by a dip switch on the bottom
of the radio, so there is only one setting at a time. It has a great receiver
--
I think it is better than a 706 about two blocks from here (the older version,

not the mkii). It's definitely better than my old TS-520S. Some folks have
blamed it for lousy mobile noise rejection and a bad noise blanker. My
response is to get rid of the noise and quite relying on the noise blanker. I
relate noise blankers to mobile noise like covering measles with makeup.

It does have some built in filters and an IF passband feature that helps clean up a lot of qrm/qrn.

I have enjoyed the DX-70 and the contacts on 20 meters with EA, GB, FT, IS, and some folks to the west of me (PA). But -- I bought it for mobile use, not general purpose. I would not have bought it to be a rig for my shack.

Good luck in your search

Tony -- KF3BX

2539. "odd" CTCSS?

I also purchased the Diamond SRH519 antenna for use on my Yaesu FT-50.
After
2 days I sent it back to HRO for a refund. The SMA connector that Diamond
uses
on this antenna has a very short center pin. When you screw this antenna
on a
FT-50, the center pin of the antenna makes contact during the last quarter
turn
(or less). This might get worse with repeated use of this antenna. That
could
be your problem. I also did not like the "memory effect" that the whip

had.
Bend it over for a few seconds and it would remember the bend. It had
that "I
just sat on my antenna" look. Try the Comet SMA503. The connector is
excellent and the whip won't remember where it's been.
John

Subject: FT847 are they any good (do i buy one)

I had an 847 for about 4 months before trading it in for a 920. Here are my impressions:
As a VHF, UHF rig or satellite rig, it's wonderful. If you don't mind the smallish controls you will love it. On the other hand, I thought it was not a very good HF rig at all. It's AGC has problems with strong adjacent signals and I basically found its DSP on CW to be useless. Anyone who does a
lot of HF CW work should compare its DSP to that of the 920 (which btw is currently available at a lower price than the 847).

I'm only going from memory here but The PTT works by putting about 2k2
across
the mic line. In this way a condenser mike can be connected straight
accross
to ptt or something like that. Any way if this value is considerably more
or
it wont ptt. Also if it is less it also wont ptt except that if it is less
putting the 2k2 of the ptt switch across it wont do any thing! Because the
earpiece doesn't have to be present on power up!
Cheers
ERIC.

Hi I have all the mod info for the TH-79a unfortunately the US/CAN version
has
neither the H/W fitted or the firmwear to allow cell RX. All others do.
The unit has no FMWide demodulator so it is impossible to demod FMW.
The other thing is if you do not implement the correct country code and
free
tx combinations ie the popular ones found on the net you may enable freetx
but you will encounter software bugs which will erase memory locations.
Cheers
ERIC.

2543. Re: TS950S, SD, SDX What is the difference???

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-26 00:00:00 UTC
From: The Kim Family <k6hm@wenet.net>
Message-ID: <35E43A03.6EF8D570@wenet.net>
Source record: 133759

Hello,
TS950sd uses Bi-polar transistors for the final RF amplifier and it has DSP built in (can be an option) for the transmitter only.
TS950SDX uses FET for the final RF amplifier and built in DSP for the transmitter and receiver. This newer model also has a function of displaying S meter for the sub receiver.
In my opinion, I have had both of them side by side and got rid of SDX and still keep a SD, SD has a better transmitting sound. The dsp function for the SDX receiver is marginal as it is the early dsp technology, and not good for the noise reduction. Both looks exactly same. The on going market price difference seem to be in the magnitude of $700 to 800 and it is not worthwhile.
Good luck to you.

> would be appreciated.

Todd-

That sounds a lot like the transmitter I built to get on the air as a novice, back in 1955. It was described in one of the ARRL booklets that was current at the time, "How To Become A Radio Amateur". I suppose it may have been published in an earlier edition of QST.

The transmitter was designed to use a single 6V6G tube, connected as a crystal oscillator. The output tank coil was link-coupled to the antenna.

I substituted a 6L6G tube, thinking it would provide more output. At least the christmas-tree-light dummy antenna was brighter. There was one drawback to using the 6L6: the crystal current was higher. I fractured a couple of crystals before it was over!

In 6 months as a Novice, I worked about 24 states on 40 and 80 meters, using this crude transmitter. I used the so-called "Full Windom" antenna, which was a 135 foot off-center fed dipole. It was fed with 300 Ohm TV twinlead, connected directly to the link on the final tank coil. We only had a single UHF television channel in the area at the time, so TVI wasn't as serious a problem as it would be today.

Good afternoon fellow hams. I recently acquired a Kenwood TS 820S and now I need a companion microphone (MC 50 would be nice but anything that will work will be accepted) This is the old 4 pin style and I believe it is hi Z.

I have nice Crossman .177 pneumatic (pump-up) target air pistol I would like to trade. . .or a sum of filthy lucre.

From: zdzislaw.sawicki@internetmci.com
Message-ID: <6s1nev$uf8$1@nnrp1.dejanews.com>
Source record: 133766

Gang: The ability to work 440 mobile SSB is not the relevant point; its Icom's lack of "User" loyalty that has me SLIGHTLY upset. My contact in Japan has indicated to me that ICOM had the IC-706 MK II G on the planing board way back in early January (way before Dayton and the FT-100 announcement)

In fact he indicated to me that the main reason that the FREE UT-106 that was offered back then was not delivered until some time in August,, was due to the fact that ICOM Japan had made the plan to replace the Mark II with the G model back in February 98.

Icom USA Marketing was not Abel to find a way of squirming out of the freebee offer, it was costing them a lot of Yen to unload the Mark II.

It is my understanding that as word of the delays in delivery of the head cabel and the DSP unit spread on the User News groups sales of the Mark II went DOWN and DOWN , giving ICOM even more and more units in INVENTORY.

Now starting again in June 1 1998 and ending in September 30 1998 ICOM is offering the $100 on the spot and the "Free" UT-106, and like a Dummy I went for it thinking that the shipping delays where over .

Now with the new knowledge of the G model in the light of day it looks like ICOM IS HOLDING A FIRE Sale, but its not letting us know it.Hi Hi,,,

It gets me VERY upset when I see manufacturers like ICOM who have complained for the longest time Years in fact, that we Hams have no BRAND loyalty's stick it to us with this type of UNDERHANDED actions. As a matter of fact just look at the September ICOM Adds in any of the magazines, everything is hunky-dory, and the price of the IC-706-Mark II that I purchased in July has plummeted $300-$400 In my Opinion its beginning to look like the (Far East)Ham rigs are beginning to depreciate as Fast and Far as Computers. I purchased The Mark II as a replacement for an older mobile Rig that was retired , I had Plans to replace my 10-year-old base Rig with at that time an ICOM IC-746. NOW I think I will hold off that decision for a wile and even then I do not think that it will be an ICOM, at least my OLD KENWOOD has held its value for the 10 years that I have had it. Just because the Far East is having an economic depression the manufacturers should not use it as an excuse. If they want us to have BRAND Loyalty then they must have some USER loyalty and provide some form of UPGRADE if the User wants it, and I do not mean a $1200 upgrade.. Hi HI.

2554. TM-V7A / Th-G71 remote control?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-26 00:00:00 UTC
From: la4waa@c2i.net
Message-ID: <35e569c1.357121@news1.c2i.net>
Source record: 133770
Cross-posted to: rec.radio.amateur.equipment,uk.radio.amateur

Hello,

Does anyone have experince with remote controlling of this rig,
TM-V7A?
The manual (added sheet) referes to a handheld with a "Kenwood Remote
Control Mode"
I have the newest Kenwood handheld, TH-G71(E) but I can not find
anything about this mode. Maybe in the A-version. (Mine is modified)
But I can send DTMF-tones in normal way. But the TM-V7 manual only
referes to a table with one-key functions, presed on the handheld,
which shall send corresponding command to the mobile transceiver.

Does anyone has a better explanation of how to do this only by DTMF-
tones? Or any other usefull information is appreachiated.

Many thanks for your help..

> The holder is marked -1.5 volts on one end and +30
> volts on the other. Can anyone tell me what kind
> of battery this thing takes and where one can be had?

From the Triplett website (http://www.triplett.com) under the "support"
button:

Model 60NA, 630/630A, 630NA/NS/PL/PLK/APL/APLK, 30 Volt. Eveready #413 is
stocked by many industrial electronics supply houses, or can be purchased
from Triplett as part number 37-19.

Triplett Corporation
One Triplett Drive, Bluffton, Ohio,
45817
Voice: 800.874.7538 / 419.358.5015
Fax: 419.358.7956

The other battery is an ordinary size D 1.5v flashlight cell....I
suggest alkaline and don't forget to check the internal meter fuse.
I renewed the panel lettering on my 630NA with a white paintstick
(available at craft stores).

Let me know if you need further details and don't forget to check out
Triplett's fascinating website.

For technical reasons that may not be interesting to you, an AM
transmission of 1W average carrier power will have a Peak Envelope
Power of 4W when fully modulated.

If the maximum power of the output circuitry of your set is 4W, as it
appears to be, then there will be no available modifications that
will not cause great distortion, a difficulty to receive your
transmissions and severe intereference with adjacent channels.

Source record: 133778

I have a 706 MkII with a DSP I bought. SO WHAT!!! It works great, I enjoy the rig, and I will probably keep it around for several years or more.

Look at that 486 computer you bought for $2000+ a few years ago. Now it makes a good door stop. SO WHAT!!! Got your use out of it didn't you?

Spent $30,000 for a car a few years ago? Now its worth $5000 on a good day. SO WHAT!!! Got your use out of it didn't you?

Put ICOM into perspective - they are a business and their sole reason for being a business is to make money. They make money by manufacturing desirable equipment, by improving upon current and past designs, and introducing new designs. They are no different than Chevrolet, Ford, Beech, SONY, and all the other businesses that are staying in business.

One last thought: I don't use 440. Where I live there is almost no activity on the band and I have no desire to spoil the wilderness.

Another consideration is, they will never tell you what paragraphs or tests under the generic MIL they're quoting, much less how testing was performed ("qualified" labs, etc.) MIL testing is laborious and expensive. I doubt seriously that ANY ham manufaturer has actually gone through all the hoops to qualify thier equipment. I asked Yaesu, once, and they blew it off. They had no idea what I was talking about!! Take it with a grain of MIL-K-876B/C salt!

Hi everyone,

Why don't we all just stop supporting Icom and perhaps they we realize
we are not going to put up with this. Personally, I plan to sell my 706
and purchase a Yaesu FT-100 (www.yaesu.com) as soon as they become
available; I will never buy another Icom product, as in good conscience,
I cannot support a company that continually puts the screws to its
customers.

From: "Jack T.Dragon" <tdragonn@blarg.net>
Message-ID: <35E493EC.4201@blarg.net>
Source record: 133789

I need some help for a friend. He just picked up a FT-73r, and wanted to mod it so that he could listen to his businesses freq but not x-mit on it. However, the radio dosen't work much outside of it's designed limits. RX drops off pretty fast. He says that there's a pot inside that'll widen the radio's RX and TX up. But without the service manual, figuring out which it is isn't easy. Can anyone help him out? He dosen't have internet access, nor even a home computer, so I'll relay messages for him.
P.S., if you think he's doing this to mess around with other freqs, he's most definately not. He's 67, and he's a Vet who strongly believes in not breaking the law. I've known him long anough to know that he's straignt. Besides, as a precaution, he's going to set the Tx freq to something so far out of band that TX power will be 0 watts. With this ht, that's easy.

You don't say what kind of rig - dual bander, VHF ???? I have used the cigarette lighter plug for years with VHF and dual band rigs. The socket is fused at 20 amps and the radio only draws 10 to 11 on full power. Just make sure you buy a GOOD plug, not some flimsy job..

Hi Clif (and the Group),

I think the key word here is "all-mode" (in reference to the 742). I personally own several Kenwood radios and am disappointed that they have not put out something to compete with with IC-706mkIIg or the FT-100. But, I have a feeling that they have an ace up their sleeve. They are probably sitting back watching the competetion and are going to put out a really outstanding product.

Come on Kenwood, don't make a liar out of me!!

Now think how that sounded. Cars are the perfect example of planned obsolescence - with annual new options, improvements, and other marketing items. Something new to suck you in and the buying public purchases them knowing this.

You should know the track record of electronics (computers, sound, communications) manufacturers. Something new as often as possible. It motivates new sales and keeps the dollars from standing still.

ICOM started this practice when the IC-751 was introduced and followed a year later with the IC-751A (with all the bugs fixed). The only thing I see ICOM doing wrong is their slow delivery of promised purchase incentives (cables, DPS units, etc..).

Where were you when Kenwood introduced the early TS-930 with mainboard problems? Or the TS-940s that mostly made a trip or two in for warranty service - yet were widely accepted? They sold widely and most are still in use today. Did you scream then?

You can hoot and holler and get mad at me or ICOM or anyone you want. But, in the end, ICOM will still be selling radios anyway. That is just how marketing is in amateur radio.

Personally, I like the MkII. I'll get my money's worth out of it and won't have a stroke learning to hate it and ICOM.

I have tried out the MAHA unit, and have ordered one. It will charge almost any Nicad or NiMh battery 12v and under, in almost any shape or format. It even comes with a cord to operate it from a vehicle.

I have three other rapid chargers. The one I bought for my Yeasu HT cost more than the MAHA unit, then I had to buy personality modules for each of the Yeasu HT's I have at $25 + a pop. To make matters worse you can't buy just one module, they come in pairs. No complaints about it's performance, just the final cost is too much.

Louis

Actually, it was a hybrid transmitter. I think only the driver and output
stage were tubes. I recall the review in QST, it must have been 1972,
and they showed a portion of the schematic where the stage was bilateral,
ie dpending on which direction the signal came from, and a bit of +12v
switching, the stage either was used for receiver or transmit. I can
picture the MOSFET's, so there were transistors in the transmitter. The
rig, after all, was meant to be transportable.

Hmmmm....

Taking an excellent product and improving it the mark of "a company
that continually puts the screws to its customers" ??? I guess I have
a warped sense of values.

Yeah, I heard about the SNAFU's over free DSP units, but how dare they
start selling the radios with the promise of a free DSP unit less than
6 months after I bought mine with no promise of a free (or even hint of
the eventual existence of a) DSP unit???? So I paid for mine and got
it before some of you got yours for free. The same option was open to
you. (When your freebie came, you could have turned around and sold it
to some other poor slob like me who couldn't get the freebie.)

In case you haven't figured it out yet, I for one PREFER that the
manufacturers continue to improve the functionality of their equipment,
even if it means that today's "state of the art" rig is "behind the
leading edge" tomorrow. In fact, they damn well BETTER continue to
improve their offerings if they want my repeat business. The radios I
have now are so nice that it will take superior technology to force me
to give them up!

Signed, a HAPPY Icom and Yaesu customer
John (KB0ZEV)

From: "Dennis B.Sheaffer" <wy3f@postoffice.ptd.net>
Message-ID: <35E35B00.94AD49D8@postoffice.ptd.net>
Source record: 133821

Yes they started the fire with the small mobile type hf rig.
If i recall reading about it when the ts-50 came out, the article stated:
Icom and yaesu were caught with there pants downwhile Kenwood introduced
the ts-50.
They must have made alot of $$$ of the ts-50 or else u would see them bring
a rig on the
market that does HF/6/2/440.
If they did'nt make the big bucks of that ts-50 maybe there caught with
there pants down.
Dont get me wrong I own alot of kenwood gear,and I enjoy using it,but I
think the items that
Icom & yaesu bring to the ham radio table are awesome.
I feel that Icom has the edge with the 706 that started it off,they seem to
be doing more than just
making hf rigs adding 6 mtrs ,yes i know the 570 has 6 mtrs too but no 2
mtrs like the 706,MK2,746
ect....
I dont have one but,I thought it was great of Icom to make a tri band
ht,right there with the 746,and the MK2 I was hooked.
I also think that Yaesu really hit the market well with the FT-847,I dont
own Yaesu gear but it seems
like there moving in the right direction also with the 847 and now the 100
mobile rig.
So yes where is Kenwood,maybe home & car audio is saving part of there ham
profit?
I e-mailed them several times to try to see what may be coming from them
.....no luck...
I told them if they dont soon get moving I will have to get a newer hf rig
and it wont have
that Kenwood logo on it.
Please dont flame me,just opened a new can of worms ,something for the
other hams to look at
and see where kenwood is at compared to Icom & yaesu...

From: DavidC <davidc@bit-net.com>
Message-ID: <01bdd063$19be8d20$628a92d0@davidc.bit-net.com>
Source record: 133825
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.policy

The following is from a spam and flame-free serious discussion of the FCC request for comments on license restructuring that is currently underway on a moderated list.

If you are interested in joining this discussion, please contact Brandon N5JYK at shoemake@uswest.net The flow of ideas is not at all directed or filtered, posts are just screened to remove any uncivilized or unrelated noise, and encouragement is given to move towards consensus on shared goals.

If we cannot rationally come to a coherent response we cannot complain if the FCC and others come up with a result we will all dislike! 73, DavidC AA1FA

Hello David,

Okay, I'll agree with you.... your a little more radical than the FCC or ARRL.
But I can see your points...

DavidC wrote:

> Here is my first look ... perhaps a little more radical than FCC or ARRL in

of
> good operating practices due to power limits is also valuable.

RE: 4) Do you mean on HF or all bands? I don't think we should cut phone
and cw
from the entry license.

David: I'm just suggesting dedicating the current Novice portions to
digital
modes, I didn't mean to suggest no phone or CW access for the entry-level
licensees on any HF band -- I address that in #5.

RE: 5) How about access to all the "traditional" bands with phone, cw, and
digital modes but with a power output of not more than 25 watts PEP. All
transmitions are limited to 25 watts PEP on the entry subbands no matter
the
class of the operator.

David: I'd want to limit it to the General Class portions so that there is
a
"tease" to upgrade to General Class for more power, and to Advanced and
Extra for limited competition in special band segments. I'd also like to
protect the Advanced and Extra portions from being over run -- we have to
remember that no matter the power level another operator is running we may
not QRM them just because we can with superior power.

I think access to 10m with 100w represents a special training ground, gets
them to buy better rigs (making the manufacturers happy).

RE: 6) see response to 5 above

RE: 7) agreed

RE: 8) The more I read this one and think about it the more I like it. With
the
caveat of 25 watts PEP instead of 100 and given cw, phone, and digital.

> C. General Class

> 4. Add all requirements for Commercial Radiotelegraph license

> 5. Add some additional benefits e.g. increased TX power on selected
bands,
> permission to use cutting-edge technologies on Extra portion of
> Amateur bands (both should not be available to others)

You may have hit upon something here. Would the present Extra's be
grandfathered in or would they be conditional for a year or... well, I
guess
I'm looking for the finer details on this one.

David: I don't think we could get by without grandfathering ...
unfortunately.

Further constructive feedback is encouraged!

I also purchased the Diamond SRH519 antenna for use on my Yaesu FT-50. After 2 days I sent it back to HRO for a refund. The SMA connector that Diamond uses on this antenna has a very short center pin. When you screw this antenna on a FT-50, the center pin of the antenna makes contact during the last quarter turn (or less). This might get worse with repeated use of this antenna. That could be your problem. I also did not like the "memory effect" that the whip had. Bend it over for a few seconds and it would remember the bend. It had that "I just sat on my antenna" look. Try the Comet SMA503. The connector is excellent and the whip won't remember where it's been.

I'm only going from memory here but The PTT works by putting about 2k2 across the mic line. In this way a condenser mike can be connected straight accross to ptt or something like that. Any way if this value is considerably more or it wont ptt. Also if it is less it also wont ptt except that if it is less putting the 2k2 of the ptt switch across it wont do any thing! Because the earpiece doesn't have to be present on power up!

Cheers
ERIC.

> Please respond to kb9ltj@hsonline.net

Hi I have all the mod info for the TH-79a unfortunately the US/CAN version has neither the H/W fitted or the firmwear to allow cell RX. All others do.

The unit has no FMWide demodulator so it is impossible to demod FMW.

The other thing is if you do not implement the correct country code and free tx combinations ie the popular ones found on the net you may enable freetx but you will encounter software bugs which will erase memory locations.

Cheers
ERIC.

David, you have this all wrong. The coil is not acting like a trap as you are describing it. The coil is a phasing coil for the UHF part of the antenna. It makes the antenna act as a collinear antenna on the UHF part and has a shorting effect for the VHF part. Depending on the design of the antenna , one variation for an antenna about 38 inches long would be a 1/2 wave antenna on 2 meters and a 5/8 over a 5/8 wave antenna on 440. That gives somewhat more gain on 440 than a 1/4 or 1/2 wave whip.

Bullshit. It is NOT all mode. It does not include the hard to find
module which is required to work FM.

Hi !

Who is working with a YAESU FL 7000 amplifier and
can give me information about it?
Power? QSK?
Is it good or is it junk?
I have the FT1000MP and want to buy a linear for this nice rig.
The new VL 1000 is much too expensive so i thought of the FL 7000.

Any info is appreciated

For $1 at a flea market, I bought a new cell phone leather case that
fits the q7 perfectly. The case has its own belt clip and the radio
slips in and out of the case fine (without the standard belt clip
connected). It also really protects the radio. I cannot use the radio
while in the case, but that does not bother me. It comes out easy enough
when I want it to. $30 for the ICOM does bother me.

This is a different product from the one normally seen with the Saitek label.
For one thing, the battery connectors in the RS unit are connected in
parallel, whereas the adverts for the Saitek mention that each cell is
independently monitored.

"Recharging" single-use alkaline cells is a tricky business at best. I would
certainly not attempt this with the Radio Shack device.

Source record: 133847

Tim,

The 847 is reviewed in the August 1998 QST. It appears to be a thorough
and objective review.

I've not used one. But I agree with Hasan on principle. If you were
not going to use the VHF/UHF capabilities, there are likely better
choices for HF alone at the same price. There must be some compromises
in a radio that has so much band coverage. One is the lack of an
internal antenna tuner (which, for me, is a big deal). For me, the lack
of VOX is not important .. but might be to some operators.

OTOH .. if you want to use all-mode on VHF/UHF, work satellites and have
HF capability in one radio, the 847 is an excellent choice, I suspect
(actually, today, the only choice!). And there is an optional external
automatic antenna tuner in the $250 price range.

It looks like that gap will widen. In the September QST, AES is
advertising the FT-847 at a price of $1849 with a caption "Price going
UP soon". Very strange considering how the dollar is much stronger than
the Yen. I wonder if the price would go done on a strong Yen ;-)

2628. Problem with keyer

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-26 00:00:00 UTC
From: Michael Melland <badger@vbe.com>
Message-ID: <35E41AEC.11B1@vbe.com>
Source record: 133854

I have a Palomar PK-44 electronic keyer. Works great except that when I hook it to my rig the "iambic" feature does not work. Hold both paddles and all ya get are dots with an occasional dash. Works fb when not connected to my ts-830s. Using shielded cable and its on its own 9v battery power source. Rig just back from check-up and it works great with no other signs of rf present on any other equoipment in the shack or other stuff connected to the rig. Looks like there is some rf or something comming back through the key connection and confusing the chip. What can I do to stop this ? Put a rf choke inline ?

punch (f) then PM and select 1-4. If you save it in 1, for instance, that is what your power up default will be. Freq, mode, etc.etc.
PM is the memory for the radio configuration. You can have 4 default configurations. Selection of them is by punching PM and then 1-4 (hitting (f) first is to save it).

cheers

Rick

Source record: 133610

> Anyone seen a good comparison of Akaline, NICAD and NIMH AA batteries - ie
> typical voltages, AH capacity, etc?

Of the rechargable options available to us...

NiCds have the shortest charge time, deliver the highest load current, and offers the lowest cost-per-cycle...but needs to be properly cared for!!

NiMH cells offer greater capacity...but must be charged differently. And NiMH cells have 1/3 to 1/5 the expected cycle life than NiCds.

Lithium Ion is coming. Li-Polymer, too. Will still be very expensive for quite a while.

The reusable alkalines aren't that much of a bargain - when compared to NiCds or even NiMH cells.

Remember: NiCds prefer full discharge between charging. NiMH cells last longer when charged only when partially depleted.

That's not surprising. The lead time for new models in Detroit is 3 years. Are you going to boycott Chevrolet or Ford because they already have a newer model on the drawing board before the current model hits the showroom floor?

It is just standard business practice to always have newer designs in progress while current designs are on the market. Do you expect them to quit selling one model before they even begin the design of the next model? That would be exceedingly silly. It would leave them with no product to sell to generate the revenue needed to pay for the design and development of the next model.

In electronics, the lead time between models may be shorter than for things like autos, due to the rapid improvements in solid state technology. The best example of that may be the PC industry. New models come out every 3 to 6 months because of the rapid pace of improvements in the technologies used in PCs. But the same thing also applies to other electronic equipment such as amateur radios. Analog technologies may not advance as fast as digital technologies, but amateur radios are becoming increasingly digital, so model changes can be expected to occur much more frequently than in the days of the KWM-2.

As with PCs, if you always wait for prices to fall and performance to increase, you'll never have a PC to use. At some point you have to grit your teeth and buy something, even though you know that in six months something better and cheaper will be available. It is the same with radios (or cars, or practially anything else). You have to make a buy decision at some point, even though it is a certainty that a newer model will be along shortly with some feature or the other that is better than the one you bought.

If you want to complain about Icom's business practices, there is ample room for that. For example, the way Icom has handled the horrible defect of the PCR-1000 is certainly shameful. But don't complain that they bring out newer models frequently. That's the way any technological market works.

Andy, The car business is a LITTLE different. They have a "new" model
every year. Sometimes it is a major change, sometimes not.

My 706MkII is a bit over a year old, so I guess I'm OK, car-wise. I
like it, it works well, and it has depreciated less than the laptop
computer I bought last year.

No complaints here.

OTOH .. in the 1980s Kenwood sold me a TS-440S and a month later came
out with the TS-450S, a better radio. Suggests to me that ICOM is not
unique in developing new products without warning us.

Yaesu has told us about the FT-100 for many months, but I've not seen
any evidence of its availability (any day now, tho). I guess that's the
vaporware concept of technology upgrades. Of course, the 706 MkIIG is
still vaporware in the US, so far as I can tell.

Don't forget the devaluation of the yen which accounts for about 25% of the price drops over the past year! Seems like rigs are cheaper now. E.G. the icom 821h was over $1600 a year ago and now you can get them for less than $1300 - same radio but now yen to dollar is 140:1 - it makes a big difference.

Source record: 133623

FYI, Radio Shack sells apower adapter with interchangable plugs, one of which fits the VX-1R. The adapter has three voltage ranges (3v, 4.5v, and 6v, if memory serves me correctly). Price is about $22 or so.

So, you can charge your VX-1R, then switch and run your Walkman CD player while chatting on the loca; repeater.

I'm sorry that I do not have the RS part number, but be careful, they have two adapters with the interchangable plugs. This one is the more expensive one, but also has the higher output capacity.

An alternative for those who don't want to pay Yaesu's prices or have the desire to homebrew one.

I have one for my VX-1R and it works great. The flexibility has come in ahndy with the kids electronic stuff as will.

Exactly. From the other side of the coin, if there was something wrong with the radio you have now or you've "outgrown" it, would you rather the manufacturer NOT bring out a newer model that address the problems? If you can't afford it, that's your problem. If you can afford it, then there's no problem. Either way, the manufacturer doesn't have a problem.

I need some help for a friend. He just picked up a FT-73r, and wanted to mod it so that he could listen to his businesses freq but not x-mit on it. However, the radio dosen't work much outside of it's designed limits. RX drops off pretty fast. He says that there's a pot inside that'll widen the radio's RX and TX up. But without the service manual, figuring out which it is isn't easy. Can anyone help him out? He dosen't have internet access, nor even a home computer, so I'll relay messages for him.
P.S., if you think he's doing this to mess around with other freqs, he's most definately not. He's 67, and he's a Vet who strongly believes in not breaking the law. I've known him long anough to know that he's straignt. Besides, as a precaution, he's going to set the Tx freq to something so far out of band that TX power will be 0 watts. With this ht, that's easy.

It isn't a matter of resetting. The problem is that the natural
frequency of the VCO is so far off that the control voltage
supplied by the error loop either hits the supply rail or bottoms
out (depending on which way the VCO is off). All you have to
do is adjust the VCO coil to bring it back to specification (2 volts
loop voltage at center of 2m band).

2657. TM-441 Rx Mod?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-27 00:00:00 UTC
From: nhulst@badlands.nodak.edu
Message-ID: <6s4d1i$54a$1@nnrp1.dejanews.com>
Source record: 133634

Our club uses a Kenwood TM-441 and it only receives from 444-449 MHz. Any idea if there is a mod that will allow it to receive a wider range of frequencies? Would be useful at times since some of our weather spotters' reports come indirectly from business frequencies at 450+ Mhz.

73 de Nick Hulst, AA0VY

2658. Re: ICOM IC-706 MKII G The Shame of it

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-27 00:00:00 UTC
From: AB2ET@my-dejanews.com
Message-ID: <6s4e4u$6di$1@nnrp1.dejanews.com>
Source record: 133635

Bill
You must be a very Rich HAM or just slow on the uptake.
I am glad that you have an IC-706MKII with DSP SO WHAT! I hope that you do not feel like you where cheated, because you will have to keep that radio for a LONG TIME to get back the Value that you put in it.

As to that Computer SO WHAT! NO I did not spend $2000 for a 486, by the sound of thing it looks like you did. I made my purchase about 2 years ago and it was a Pentium 100, I spent about $1,500 and with that decision I have the ABILITY to UPGRADE my Computer and on two occasions I did ,so that it is still "state of the art" at 330 MHz. For less then $400, All of this with UPGRADES and not like iBOM with a "Fork Lift Upgrade"

No I did not spend $30,000 for a car that is now worth $5,000 SO WHAT! Boy oh boy you must be very hard on your cars, it must feel hemoroidal if you are only Abel to recover $5,000 for that $30,000 car is that the same story with the iBOM,? Or you are not Abel to get a good deal from that financial adviser. Can I possibly interest you in a 1979 Ford Pinto; it has only 60,000 miles

In your next statement you indicate that iBom is in the profit business. I shure hope so, and it looks like they are doing it with your money And I love the statment that they " improving upon current and past designs, and introducing new designs. Well in that statement you are ABSOLUTELY RIGHT they have IMPROVED the design of the MK-I that had a bunch of shortcomings in about 7 months with the MKII that some corrections to the first design but no great leaps of technology, and now 8 months later we have the MKII-G . Well I hope that after (3) count them (3) attempts they get it right this time. Boy oh boy some way to run a business" get the customers to fix your design by doing a "Fork Lift Upgrade" on them and only charge them $1,200 for each one. And call it technological progress... Can I nterest you in some Russian COLD Fusion Research Bonds?.

I am glad that you want to keep the Wilderness at 440 MHz Pure and Clean.
And as the proud owner of an IC-706-MKII you will certainly be Abel to do that with no problems.
I have disposed of MY IC-706MKII with thank God no loss of money to ME, at the same time I CANCELD MY ORDER for the iBOM IC-746.

My 6-year-old TS-850SAT has worked well has held its value over its life and I did get service from it, it looks like iBom has lost me as a customer now and in the future.

Well it looks like the TS-850SAT will have to carry on doing its well-depreciated duty for a wile more.

I am not a crybaby as some of the great minds on the net make it look like;
they all missed my point
I am not a rich man, by the sound of some on the net that is or are just high
on the ?Loony? .hi hi

I will pay my hard-earned dollars for value that has some staying power. I
love the technology, the bells and whistles and most likely more then most,
but when an Company starts to use me as a test bed for their multi inept
designs, pathetic attempt at market research and then starts to blatantly
GOUGE my pocket book, and blatently mis inform (the DSP FUPA) at that point I
will no longer support them or any FUTURE products from them.

This new "I dont give Dam" attitude must be a result of some form of change
in corporate culture at ICOM or ICOM America, ICOM in the Past NEVER had this
type of attitude.

Well by all signs coming from Japan and the Far East the policy that iBOM and
others Asian entities have developed in the past like coming out with 2 new
models per year to market more devices has not paid off.

It looks like they are in a big hole.and as the free market gang states only
the strong will survive, for me that means a company that will give me Value
and staying power of their product.

I do not have $500-$800 to kick out for my hobby every year for a new radio,
and YES the dollars do matter, I will in the future look at a company that
gives me VALUE for my dollar and some form of stability in retention of that
value.

THANK YOU ICOM for waking me up to the reality of your new economic strategy,
it is one that I will not be joining in again.
I will wait to see what the rig shoot out will bring this fall and winter

73,
Steve

>[snip]

I think that neither the analogy of car buying can be 100% extended to
ham gears, nor it is correct to boycott any manufactures for their
continuation effort of product improvement.

When I walk into a car dealer place looking for a "brand new" 98 model
car tomorrow, I should already be prepared for the fact that the 98
"MODEL" has only a few more months left. Similarly, when I call up
HRO to order an IC-706MKII, I should also be prepared that ICOM is
working on the enhancement, or a replacement of the said product.

The real difference between the two is whether I know exactly how much
longer before my purchase will become an old model product. Car
dealers are forced to be a LITTLE BIT more honest in this because they
cannot hide the year made and mileage on a car. In contrast, unless
the manufacturer/dealer tells you, you'll have no way of telling when
your rig is being replaced or upgraded.

Chasing after the newest product is like shooting a moving target.
Only gadget gizmos do that. Also, only these people will get burnt
the most because they cannot get pass the mental block of keeping what
they have bought.

Finally, I do feel that manufacturers should keep an open mind of
allowing an upgrade path if they are willing to listen to customers
and put them first.

Best 73!

2669. Re: ICOM IC-706 MKII G The Shame of it

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-27 00:00:00 UTC
From: NE7X <NE7X@amsat.org>
Message-ID: <35E5D2B3.255A@amsat.org>
Source record: 133646

So why don't the radio manufactures build radios that will allow for either hardware or firmware upgrades? A perfect example is the Icom IC-756. The firmware is a surface mounted ROM. I use to own a Kenwood TS-940S which had a socketed EPROM. I purchased several off market firmware upgrades, keeping the radio from becoming obsolete a little longer.

Most car or computer manufactures allow for upgrades. I can buy a new radio, tires, fender, bumper, or whatever for a car. For my computer I can purchase a new sound card, hard drive, or video card keeping the computer from becoming obsolete over night. Why not do this for amateur radio equipment also?

My personal opinion is that radio manufactures want radios to become obsolete so they can sell more radios. Their in the business to manufacture and sell radios, make money. So as long as the hams are willing to shell out $$$$s every time a manufacture comes up with a new whistle-n-bell radio, the manufactures will continue to do this practice.

I personally purchase only used radios, cars and computers. This way I may not be up with the Jones, however I still have some really nice toys without taking big depreciation hits!

Source record: 133649

I've used the program for a year now.

I haven't compared multicom to anything else on sstv so I can't make a direct comparison. I use it for vhf packet, hf rtty, hf pactor and listening on hf sstv. On the other modes it is a fine performer. I have tried a few other pactor and rtty programs and found that the increased functionality of the other programs is not worth the learning time.

The images received are certainly acceptable. If I get a good signal I get a good image. I have heard some people complain about the images being skewed but I have never seen that here. What I like the best is the auto sensing that the program does to set the mode for me. It took some "messing" to get it configured right but now is pretty much automatic. I use it about once a week when I have nothing else to do,

My two beefs...

the sstv display window is fairly small.

The program is buggy. Nothing major, just little things that become annoying over time. Overall, it does function as specified.

For me the major selling point was in having everything in one program that was easy to set up and operate. It meets my needs.

Gordon West Radio School Presents:

A
General 13-wpm Morse Code
And Theory Review Class

October 10th & 11th 1998 (San Diego, CA)

General 13-wpm Morse Code and Theory Review Class - 10/10/98 and 10/11/98
==========

Location: West Marine, San Diego, CA.

This class is for mariners that want to upgrade to the General Class license, but like many people, find the 13wpm Morse Code requirement their biggest stumbling block! Make 1998 your year to upgrade. Don't let the Code hold you back any longer, the Worldwide HF bands are waiting for you. In fun, stress-free way, your instructor will take you from a shaky 8-wpm all the way up to 13-wpm, or higher, in preparation for your exam on Sunday afternoon! Techniques in passing the CW exam will be taught, and there will be multiple demonstrations showing just how easy it is for YOU to pass the 13-wpm, or even the 20-wpm code exam! Theory review sessions are held throughout the two days to help make passing the written exam even easier. Students that pre-register will receive the Gordon West "General Class" textbook, Gordo's exclusive CW tapes, and a special pre-study package. The class fee includes sixteen hours of tuition, beverages and lunch on both days and a barbecue on Saturday evening. General Class students join Gordo and his No-Code Technician class for an operating session and workshop dedicated to installing, using and maintaining ham radio equipment aboard yachts and powerboats.

--==--

Weekend courses include:
o Beverages, snacks and lunches
o Saturday night "Operating Session" with Gordon West
o Home study package consisting of CW tapes, book and
computer software
o Audio tapes for home study
o Sample test preparation exams, just like the real thing
o Multiple code test-passing opportunities

Only Prerequisite: All students must be able to copy code at 8-WPM prior to coming to class.

For full details on either of the classes described above, please call Gordon West at (714) 549-5000 between 10am and 4pm, Monday through Friday.

Source record: 133652

Boy, you talk about a naive idiot...

Car manufacturers plan their vehicles YEARS in advance. They are PLANNED to be obsolete as soon as you drive them off the showroom floor. THEY ARE ALL DISCONTINUED MODELS BEFORE THEY ARE EVEN SOLD. That's why they drop in value by 25 to 40% the minute they drive off the sales lot. If you don't KNOW this then you are their ideal customer. By the way, now is the time for the new models to come out. Get the newspaper and note that there are two models on the lots; the 97s and the 98s. Guess which one has more features. Guess which one is discounted. How much howling do you hear from people that bought the 97s? Probably very little since this is the way the world is.

Here's some homework for all of you whiners. It is due tomorrow. For the newsgroup, name ten products you can buy today that there has never been a "new and improved" version of and the company is still in existence. You should also tell us which of these companies you are currently indignant about and boycotting.

By the way, I have a 706mk2. I love it. I am looking forward to buying either the G or FT100. The mk2 will be retired to my wife's car at that time.

TMV-7A External Remote Control Operation.

1) TURN ON DTSS FUNCTION FOR THE V7A UHF SIDE
SET DTSS NUMBER AND TURN OFF DTSS

2) PRESS THE BAND SELECT BUTTON FOR THE VHF SIDE
3) TURN OFF HOLD CONT-SEL KEY AND TURN ON

4) THIS WILL ENABLE EXT STANDBY MODE.
Ext remote ARE DISPLAYED.
DT INDICATOR FOR UHF FLASHING.
LOCK INDICATOR IS ON.

FRONT PANNEL KEYS DISABLED EXCEPT PWR AND MIKE KEYS.
YOU CAN TURN OFF DTMF ANSWER BACK USING MENU KEY.

5)TO BEGIN REMOTE KEY - ON HAND HELD KEY [A] [1] [1] [3] [♯]
(if you use 113 as the code)

IF OK V7A WILL BEEP. ABD DT WILL STOP FLASHING. THEN YOUR ARE IN REMOTE.

6) TO RETURN TO STANDBY ENTER [A] [♯] AND DT WILL START FLASHING.

7) TO RETURN TO NORMAL TURN OFF. HOLD CONTROL AND TURN ON

[1] REV ON [2] TONE ON [3] CTCSS ON [A] ENT
[4] REV OFF [5] TONE OFF [6] CTSS OFF [B] TONE SEL
[7] CALL [8] VFO [9] MR [C] REPEAT ON
[9] DWN [0] LOW [♯] UP [D] REPEAT OFF

That's certainly true. For a radio that is used regularly, either NiCd
or NiMH is a better choice.

The place alkalines come into their own is with a radio that is used
infrequently, and where NiCd or NiMH cells would lose much of their
capacity between uses of the radio. In that case, alkalines make
more sense, and rechargeable alkalines are cheaper than single-use
alkalines.

In the case of 5 W handhelds, rechargeable alkalines are probably not
a good choice, because their internal resistance is higher than the
throwaway type and 5 W handhelds can draw nearly 2 A from the battery
pack during transmit. But for the few-hundred-milliwatt transceivers,
or radios used for receive only, rechargeable alkaline should be fine.

Dave

>I am thinking of getting a rapid charger for HT's, eg. FT-50.
>The obvious choice is the Yaesu rapid charger.
>Has anyone tried out the MAHA ones that supposedly will recharge most
>anything?

Through a set of circumstances I won't explain, I have both.

If you just want to charge Yaesu battery packs, and cost is no object,
get the Yaesu. It has little cups that fit the radio or battery pack
exactly. It charges at 800 mA, so it's quite fast. You can drop
two radios/packs into it at once and it will fast-charge one, then switch
to the other and charge it, then keep both on trickle charge - all without
human intervention.

On the other hand, the MAHA charger does work. It doesn't have cups to
fit the radio unless you want to make them yourself. In normal operation,
the battery pack sticks to the top of the charger with a magnet. Funny
adjustable pins contact the battery charging contacts. These pins are
adjustable over a wide range, but it takes a while to adjust them.
If you have only one type of battery pack to charge, you adjust the
pins once and you're done. But if you have multiple types of batteries,
you end up spending your life adjusting the pins. In that case, I'd
either recommend buying one MAHA charger for each battery type, or
building little outboard battery cups for each type of battery.

The MAHA charges at 650 mA, a little slower than the Yaesu. It will
discharge batteries (the Yaesu will not). It has a temperature sensor
that you stick to the battery pack with a magnet; this makes it safe
for charging NiMH batteries. (Yaesu says *not* to use NiMH packs in
their charger). The magnet on the MAHA isn't always strong enough to
hold the pack against the spring-loaded pins, if the pack has its
contacts on the end instead of the side.

I also charge a set of 4 NiCd or NiMH batteries used in my GPS by
inserting them into a 4 AA battery holder and putting *that* on the MAHA.

The Yaesu charger is a more elegant solution for charging Yaesu radio
batteries. The MAHA charger is less elegant, but covers a much wider
range of charging.

Nicely stated post John, while everyone here is suing Icom I instead will be looking forward to receiving a new IC-706MkII. Shame on Icom for improving their product!

Not that I'm a lover of Icom, but if someone couldn't improve upon a product for fear of stepping on a few toes we'd still be drifting all over using crap like Swan turned out.

Geez, I'm surprised that no one has crucified Yaesu yet for introducing the FT-100 which is probably the main cause for Icom to revise the MkII. I guess no one has ever read those little disclaimers on brochures and manuals regarding features and specifications that "may be changed without notice."

I just hope that Icom comes to a complete stop in improving technology after the release of the MkIIG, god forbid new improvements appear!

Bud

2680. FS: Kenwood TS-430s Station, Lots of Misc. Items

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-27 00:00:00 UTC
From: "gavilan1@earthlink.net" <gavilan1@earthlink.net>
Message-ID: <35E5F87F.155AA390@earthlink.net>
Source record: 133657
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Greetings. I have the following HF station for sale. I would like to sell the whole shooting match as a package, but will entertain offers to buy individual items (given a brief waiting period of one week, in case a station buyer materializes...). Everything is in excellent condition, and the rig is loaded with all of the filters - CW, narrow SSB, AM, and the optional FM board.

Station consists of the following components:

1 - TS-430s HF Transceiver, 10-160M, AM/FM/CW/SSB, digital, fluorescent blue display, dual VFO, memories, scan, VOX, wideband, manual.

1 - PS-50 H.D. Power Supply (identical to the TS-430s style, height, etc., but beefier than the stock PS-430s. Has 12VDC connections on rear for other rigs also.

1 - MC-80 Desk Mic, electret, with UP/DOWN frequency control, mini jack for boom mic

1 - Kenwood Stock Mobile TouchTone Mic, for mobile use (never used) - I can't remember the model number

1 - Mobile Mounting Bracket for TS-430s (never used)

1- AT-250 Automatic Antenna Tuner, 10-160M, with control cable for TS-430s

Asking $1,200 for the complete station, plus shipping, or you pick it up in Orange County, California.

Other items that I will list separately (plus shipping) are:

1 - Bencher paddle with MFJ autokeyer, $75

1 - Timewave DSP-59+, 3.0 firmware, excellent condition, manual, $175

1 - Ameco PT-5 Preamp, dual FET, like new (3 mos. old), autoswitching, 10-160M, $80

1 - Heath Cantenna 1 Gal. Dummy Load, with oil, $25 (this item pick-up only)

1 - Cushcraft AR-10 Ringo, 10M vertical, near new, $40 (this item pick-up only)

1 - Ham-IV rotator, with controller, upper & lower mast brackets, mast plate on 24" of 2" tubing for use with tubular tower, min. 50' cable, $250

1 - Ham-IV rotator, with upper bracket only, $200

1 - Tristao 55' crank-up 3-section triangular tower, guyed, with tilt baseplate, 2" mast termination, $200 (this item pick-up only, in Los Angeles proper)

1 - Alliance HD-73-II rotator, with controller, upper & lower mast brackets, min. 50' of cable, $150

1 - Telex - Hy-Gain Explorer 14 HF wideband yagi, 10-15-20-40M, designed for solid state rigs, needs to be cleaned up before reassembling, manuals, $200
(this item pick-up only)

1 - 10M dipole with 1:1 balun, cut for 10M phone (28.3 - 28.5MHz), $20

1- AEA (?) Low Pass Filter, 1Kw, $20

1 - Hustler 2M Whip, center loaded (load is about 12", white), about 6.5' long (I forgot the model number), best 2M whip I ever used in my life, 3/8" lug, $30

1 - CommSpec TE-64, with mounting bracket, $40

1 - Heath FM Deviation Meter, $50

If you are interested, please e-mail me.

length,
> which is the electrical length of the two parts plus coil.
David, you have this all wrong. The coil is not acting like a trap as you
are
describing it. The coil is a phasing coil for the UHF part of the antenna.
It
makes the antenna act as a collinear antenna on the UHF part and has a
shorting
effect for the VHF part. Depending on the design of the antenna , one
variation
for an antenna about 38 inches long would be a 1/2 wave antenna on 2 meters
and a
5/8 over a 5/8 wave antenna on 440. That gives somewhat more gain on 440

than a
1/4 or 1/2 wave whip.

It isn't a matter of resetting. The problem is that the natural
frequency of the VCO is so far off that the control voltage
supplied by the error loop either hits the supply rail or bottoms
out (depending on which way the VCO is off). All you have to
do is adjust the VCO coil to bring it back to specification (2 volts
loop voltage at center of 2m band).

Subject: FS: Yaesu VX-1R power plugs
FYI, Radio Shack sells apower adapter with interchangable plugs, one of
which
fits the VX-1R. The adapter has three voltage ranges (3v, 4.5v, and 6v, if
memory serves me correctly). Price is about $22 or so.
So, you can charge your VX-1R, then switch and run your Walkman CD player
while chatting on the loca; repeater.
I'm sorry that I do not have the RS part number, but be careful, they have
two
adapters with the interchangable plugs. This one is the more expensive one,
but also has the higher output capacity.
An alternative for those who don't want to pay Yaesu's prices or have the
desire to homebrew one.
I have one for my VX-1R and it works great. The flexibility has come in
ahndy
with the kids electronic stuff as will.

Subject: ICOM IC-706 MKII G The Shame of it
Gang: The ability to work 440 mobile SSB is not the relevant point; its
Icom's lack of "User" loyalty that has me SLIGHTLY upset. My contact in
Japan
has indicated to me that ICOM had the IC-706 MK II G on the planing board
way
back in early January (way before Dayton and the FT-100 announcement)
In fact he indicated to me that the main reason that the FREE UT-106 that
was
offered back then was not delivered until some time in August,, was due to
the
fact that ICOM Japan had made the plan to replace the Mark II with the G
model
back in February 98.
Icom USA Marketing was not Abel to find a way of squirming out of the
freebee offer, it was costing them a lot of Yen to unload the Mark II.
It is my understanding that as word of the delays in delivery of the head
cabel and the DSP unit spread on the User News groups sales of the Mark II
went DOWN and DOWN , giving ICOM even more and more units in INVENTORY.
Now starting again in June 1 1998 and ending in September 30 1998 ICOM is
offering the $100 on the spot and the "Free" UT-106, and like a Dummy I
went
for it thinking that the shipping delays where over .
Now with the new knowledge of the G model in the light of day it looks
like

ICOM IS HOLDING A FIRE Sale, but its not letting us know it.Hi Hi,,,
It gets me VERY upset when I see manufacturers like ICOM who have
complained
for the longest time Years in fact, that we Hams have no BRAND loyalty's
stick it to us with this type of UNDERHANDED actions. As a matter of fact
just look at the September ICOM Adds in any of the magazines, everything
is
hunky-dory, and the price of the IC-706-Mark II that I purchased in July
has
plummeted $300-$400 In my Opinion its beginning to look like the (Far
East)Ham rigs are beginning to depreciate as Fast and Far as Computers. I
purchased The Mark II as a replacement for an older mobile Rig that was
retired , I had Plans to replace my 10-year-old base Rig with at that time
an
ICOM IC-746. NOW I think I will hold off that decision for a wile and even
then I do not think that it will be an ICOM, at least my OLD KENWOOD has
held
its value for the 10 years that I have had it. Just because the Far East is
having an economic depression the manufacturers should not use it as an
excuse. If they want us to have BRAND Loyalty then they must have some USER
loyalty and provide some form of UPGRADE if the User wants it, and I do not
mean a $1200 upgrade.. Hi HI.

Subject: ICOM IC-706 MKII G The Shame of it
Exactly. From the other side of the coin, if there was something
wrong with the radio you have now or you've "outgrown" it, would you
rather the manufacturer NOT bring out a newer model that address the
problems? If you can't afford it, that's your problem. If you can
afford it, then there's no problem. Either way, the manufacturer
doesn't have a problem.

You went for the bait just to save a few bucks, and now you'll pay for it
in
the form of having a rig that is being replaced with an improved model.
That
is Icom's right. Deal with it.

Subject: Anyone Have a Good Comparison of AA Batteries
> Anyone seen a good comparison of Akaline, NICAD and NIMH AA batteries -
ie
> typical voltages, AH capacity, etc?
Of the rechargable options available to us...
NiCds have the shortest charge time, deliver the highest load current, and
offers the lowest cost-per-cycle...but needs to be properly cared for!!
NiMH cells offer greater capacity...but must be charged differently. And
NiMH
cells have 1/3 to 1/5 the expected cycle life than NiCds.
Lithium Ion is coming. Li-Polymer, too. Will still be very expensive for
quite a while.
The reusable alkalines aren't that much of a bargain - when compared to
NiCds
or even NiMH cells.
Remember: NiCds prefer full discharge between charging. NiMH cells last
longer
when charged only when partially depleted.

From: jpoulin@honk.org
Subject: Fixing PLL on HTX-202
I would really like to get to the bottom of an onging
problem with the HTX-202 Radios, that many people are
experiencing.
The error "ER2" normaly displays when the PLL curcuit
becomes unlocked.
Now my HTX-202 displays ER2 in receive mode. The minute
I turn on the radio BANG! .. ER2
I called Radio Shack, and they said to bring it in for
servicing, however the service centre in eastern Canada is
backlogged, and I dont want to wait.
Does anyone know how to reset the PLL curcuit on this
radio ?
I have tried the CPU reset (Function-CLR) during POWER-UP
but it did not help.
I would much rather do a quick fix, rather than sending

it to RS.
Any help would be greatly appreciated.

> Is there any software I can use ?. In alternative, a TNC could work?
> Thanks in advances
Try a "packet modem" TNC, particularly the "Baycomm" type.
They are based on a "modem" chip (TI TCM3105) that is compatible
with the modem FSK specs. By jumpering a few pins, you can change
the receive tone pairs. Search for "Baycomm modem schematic".
Note that the Baycomm modem data is sent through the handshaking
pins, and not the RX/TX pins of the serial interface. You will
need to rewire the connector.
Or, look for two shareware programs called "Hamcomm" and
"Radioraft". They can be set for custom mark-space freqs, shifts
and baudrates. They both require the "Hamcomm" interface - the
same one used for MDT, Trunker, POSCAG, etc, etc. The circuit is
included in the doc's.
Good Luck!
Cheers,
Paul Grohe

Subject: ICOM IC-706 MKII G The Shame of it
I agree with you Bill. I bought the boards to put together a computer
that was up to date in Jan this year. Less than 3 months later, the $
200 drive I bought was selling for $ 150 and the main processor had
dropped about the same. Something I knew was going to happen, but I
needed or wanted to upgrade the computer I was using.
About the only thing about Icom that I don't like were the models that

had the memory module that had a battery to store the main functions.
If that <make that when> the battery goes dead, your radio is worthless
until you send the module back for reprogramming. That was a bad choice

by Icom, but The new models coming out is just good business. Just as a
new car comes out every year.

That's not surprising. The lead time for new models in Detroit is 3 years.
Are
you going to boycott Chevrolet or Ford because they already have a newer
model on the drawing board before the current model hits the showroom
floor?
It is just standard business practice to always have newer designs
in progress while current designs are on the market. Do you expect them
to quit selling one model before they even begin the design of the next
model? That would be exceedingly silly. It would leave them with no
product to sell to generate the revenue needed to pay for the design
and development of the next model.
In electronics, the lead time between models may be shorter than for
things like autos, due to the rapid improvements in solid state technology.
The best example of that may be the PC industry. New models come
out every 3 to 6 months because of the rapid pace of improvements in
the technologies used in PCs. But the same thing also applies to other
electronic equipment such as amateur radios. Analog technologies
may not advance as fast as digital technologies, but amateur radios
are becoming increasingly digital, so model changes can be expected
to occur much more frequently than in the days of the KWM-2.
As with PCs, if you always wait for prices to fall and performance to
increase,
you'll never have a PC to use. At some point you have to grit your teeth
and
buy something, even though you know that in six months something better and

cheaper will be available. It is the same with radios (or cars, or
practially anything
else). You have to make a buy decision at some point, even though it is a
certainty
that a newer model will be along shortly with some feature or the other
that is
better than the one you bought.
If you want to complain about Icom's business practices, there is ample
room
for that. For example, the way Icom has handled the horrible defect of the
PCR-1000 is certainly shameful. But don't complain that they bring out
newer
models frequently. That's the way any technological market works.

Andy, The car business is a LITTLE different. They have a "new" model
every year. Sometimes it is a major change, sometimes not.
My 706MkII is a bit over a year old, so I guess I'm OK, car-wise. I
like it, it works well, and it has depreciated less than the laptop
computer I bought last year.
No complaints here.
OTOH .. in the 1980s Kenwood sold me a TS-440S and a month later came
out with the TS-450S, a better radio. Suggests to me that ICOM is not
unique in developing new products without warning us.
Yaesu has told us about the FT-100 for many months, but I've not seen
any evidence of its availability (any day now, tho). I guess that's the
vaporware concept of technology upgrades. Of course, the 706 MkIIG is
still vaporware in the US, so far as I can tell.

Subject: ICOM IC-706 MKII G The Shame of it
Don't forget the devaluation of the yen which accounts for about 25% of the
price drops over the past year! Seems like rigs are cheaper now. E.G. the
icom 821h was over $1600 a year ago and now you can get them for less than
$1300 - same radio but now yen to dollar is 140:1 - it makes a big
difference.

may
> act like a low impedance, and the antenna behaves as one continuous
length,
> which is the electrical length of the two parts plus coil.
David, you have this all wrong. The coil is not acting like a trap as you
are
describing it. The coil is a phasing coil for the UHF part of the antenna.
It
makes the antenna act as a collinear antenna on the UHF part and has a
shorting
effect for the VHF part. Depending on the design of the antenna , one
variation
for an antenna about 38 inches long would be a 1/2 wave antenna on 2 meters
and a
5/8 over a 5/8 wave antenna on 440. That gives somewhat more gain on 440

than a
1/4 or 1/2 wave whip.

It isn't a matter of resetting. The problem is that the natural
frequency of the VCO is so far off that the control voltage
supplied by the error loop either hits the supply rail or bottoms
out (depending on which way the VCO is off). All you have to
do is adjust the VCO coil to bring it back to specification (2 volts
loop voltage at center of 2m band).

From: chuckful@my-dejanews.com
Subject: FS: Yaesu VX-1R power plugs
FYI, Radio Shack sells apower adapter with interchangable plugs, one of
which
fits the VX-1R. The adapter has three voltage ranges (3v, 4.5v, and 6v, if
memory serves me correctly). Price is about $22 or so.
So, you can charge your VX-1R, then switch and run your Walkman CD player
while chatting on the loca; repeater.
I'm sorry that I do not have the RS part number, but be careful, they have
two
adapters with the interchangable plugs. This one is the more expensive one,
but also has the higher output capacity.
An alternative for those who don't want to pay Yaesu's prices or have the
desire to homebrew one.
I have one for my VX-1R and it works great. The flexibility has come in
ahndy
with the kids electronic stuff as will.

Subject: ICOM IC-706 MKII G The Shame of it
Gang: The ability to work 440 mobile SSB is not the relevant point; its
Icom's lack of "User" loyalty that has me SLIGHTLY upset. My contact in
Japan
has indicated to me that ICOM had the IC-706 MK II G on the planing board
way
back in early January (way before Dayton and the FT-100 announcement)
In fact he indicated to me that the main reason that the FREE UT-106 that
was
offered back then was not delivered until some time in August,, was due to
the
fact that ICOM Japan had made the plan to replace the Mark II with the G
model
back in February 98.
Icom USA Marketing was not Abel to find a way of squirming out of the
freebee offer, it was costing them a lot of Yen to unload the Mark II.
It is my understanding that as word of the delays in delivery of the head
cabel and the DSP unit spread on the User News groups sales of the Mark II
went DOWN and DOWN , giving ICOM even more and more units in INVENTORY.
Now starting again in June 1 1998 and ending in September 30 1998 ICOM is
offering the $100 on the spot and the "Free" UT-106, and like a Dummy I
went
for it thinking that the shipping delays where over .
Now with the new knowledge of the G model in the light of day it looks
like

ICOM IS HOLDING A FIRE Sale, but its not letting us know it.Hi Hi,,,
It gets me VERY upset when I see manufacturers like ICOM who have
complained
for the longest time Years in fact, that we Hams have no BRAND loyalty's
stick it to us with this type of UNDERHANDED actions. As a matter of fact
just look at the September ICOM Adds in any of the magazines, everything
is
hunky-dory, and the price of the IC-706-Mark II that I purchased in July
has
plummeted $300-$400 In my Opinion its beginning to look like the (Far
East)Ham rigs are beginning to depreciate as Fast and Far as Computers. I
purchased The Mark II as a replacement for an older mobile Rig that was
retired , I had Plans to replace my 10-year-old base Rig with at that time
an
ICOM IC-746. NOW I think I will hold off that decision for a wile and even
then I do not think that it will be an ICOM, at least my OLD KENWOOD has
held
its value for the 10 years that I have had it. Just because the Far East is
having an economic depression the manufacturers should not use it as an
excuse. If they want us to have BRAND Loyalty then they must have some USER
loyalty and provide some form of UPGRADE if the User wants it, and I do not
mean a $1200 upgrade.. Hi HI.

Subject: ICOM IC-706 MKII G The Shame of it
Exactly. From the other side of the coin, if there was something
wrong with the radio you have now or you've "outgrown" it, would you
rather the manufacturer NOT bring out a newer model that address the
problems? If you can't afford it, that's your problem. If you can
afford it, then there's no problem. Either way, the manufacturer
doesn't have a problem.

You went for the bait just to save a few bucks, and now you'll pay for it
in
the form of having a rig that is being replaced with an improved model.
That
is Icom's right. Deal with it.

Subject: NDi 2 Metre fm Tranceiver.
I recently purchased a 2 metre tranceiver at a radio rally . The rig is an
NDi.
My question is if anyone has heard of this make? It is a solid well built
mobile,
model hc-1400,a little bulky by modern mobile standards and built possibly
for the American market. Any info gratefully received.
Thanks,
John. de G0WQA.

may
> act like a low impedance, and the antenna behaves as one continuous
length,
> which is the electrical length of the two parts plus coil.
David, you have this all wrong. The coil is not acting like a trap as you
are
describing it. The coil is a phasing coil for the UHF part of the antenna.
It
makes the antenna act as a collinear antenna on the UHF part and has a
shorting
effect for the VHF part. Depending on the design of the antenna , one
variation
for an antenna about 38 inches long would be a 1/2 wave antenna on 2 meters
and a
5/8 over a 5/8 wave antenna on 440. That gives somewhat more gain on 440

than a
1/4 or 1/2 wave whip.

It isn't a matter of resetting. The problem is that the natural
frequency of the VCO is so far off that the control voltage
supplied by the error loop either hits the supply rail or bottoms
out (depending on which way the VCO is off). All you have to
do is adjust the VCO coil to bring it back to specification (2 volts
loop voltage at center of 2m band).

From: chuckful@my-dejanews.com
Subject: FS: Yaesu VX-1R power plugs
FYI, Radio Shack sells apower adapter with interchangable plugs, one of
which
fits the VX-1R. The adapter has three voltage ranges (3v, 4.5v, and 6v, if
memory serves me correctly). Price is about $22 or so.
So, you can charge your VX-1R, then switch and run your Walkman CD player
while chatting on the loca; repeater.
I'm sorry that I do not have the RS part number, but be careful, they have
two
adapters with the interchangable plugs. This one is the more expensive one,
but also has the higher output capacity.
An alternative for those who don't want to pay Yaesu's prices or have the
desire to homebrew one.
I have one for my VX-1R and it works great. The flexibility has come in
ahndy
with the kids electronic stuff as will.

Subject: ICOM IC-706 MKII G The Shame of it
Gang: The ability to work 440 mobile SSB is not the relevant point; its
Icom's lack of "User" loyalty that has me SLIGHTLY upset. My contact in
Japan
has indicated to me that ICOM had the IC-706 MK II G on the planing board
way
back in early January (way before Dayton and the FT-100 announcement)
In fact he indicated to me that the main reason that the FREE UT-106 that
was
offered back then was not delivered until some time in August,, was due to
the
fact that ICOM Japan had made the plan to replace the Mark II with the G
model
back in February 98.
Icom USA Marketing was not Abel to find a way of squirming out of the
freebee offer, it was costing them a lot of Yen to unload the Mark II.
It is my understanding that as word of the delays in delivery of the head
cabel and the DSP unit spread on the User News groups sales of the Mark II
went DOWN and DOWN , giving ICOM even more and more units in INVENTORY.
Now starting again in June 1 1998 and ending in September 30 1998 ICOM is
offering the $100 on the spot and the "Free" UT-106, and like a Dummy I
went
for it thinking that the shipping delays where over .
Now with the new knowledge of the G model in the light of day it looks
like

ICOM IS HOLDING A FIRE Sale, but its not letting us know it.Hi Hi,,,
It gets me VERY upset when I see manufacturers like ICOM who have
complained
for the longest time Years in fact, that we Hams have no BRAND loyalty's
stick it to us with this type of UNDERHANDED actions. As a matter of fact
just look at the September ICOM Adds in any of the magazines, everything
is
hunky-dory, and the price of the IC-706-Mark II that I purchased in July
has
plummeted $300-$400 In my Opinion its beginning to look like the (Far
East)Ham rigs are beginning to depreciate as Fast and Far as Computers. I
purchased The Mark II as a replacement for an older mobile Rig that was
retired , I had Plans to replace my 10-year-old base Rig with at that time
an
ICOM IC-746. NOW I think I will hold off that decision for a wile and even
then I do not think that it will be an ICOM, at least my OLD KENWOOD has
held
its value for the 10 years that I have had it. Just because the Far East is
having an economic depression the manufacturers should not use it as an
excuse. If they want us to have BRAND Loyalty then they must have some USER
loyalty and provide some form of UPGRADE if the User wants it, and I do not
mean a $1200 upgrade.. Hi HI.

Subject: NDi 2 Metre fm Tranceiver.
I recently purchased a 2 metre tranceiver at a radio rally . The rig is an
NDi.
My question is if anyone has heard of this make? It is a solid well built
mobile,
model hc-1400,a little bulky by modern mobile standards and built possibly
for the American market. Any info gratefully received.
Thanks,
John. de G0WQA.

may
> act like a low impedance, and the antenna behaves as one continuous
length,
> which is the electrical length of the two parts plus coil.
David, you have this all wrong. The coil is not acting like a trap as you
are
describing it. The coil is a phasing coil for the UHF part of the antenna.
It
makes the antenna act as a collinear antenna on the UHF part and has a
shorting
effect for the VHF part. Depending on the design of the antenna , one
variation
for an antenna about 38 inches long would be a 1/2 wave antenna on 2 meters
and a
5/8 over a 5/8 wave antenna on 440. That gives somewhat more gain on 440

than a
1/4 or 1/2 wave whip.

It isn't a matter of resetting. The problem is that the natural
frequency of the VCO is so far off that the control voltage
supplied by the error loop either hits the supply rail or bottoms
out (depending on which way the VCO is off). All you have to
do is adjust the VCO coil to bring it back to specification (2 volts
loop voltage at center of 2m band).

From: chuckful@my-dejanews.com
Subject: FS: Yaesu VX-1R power plugs
FYI, Radio Shack sells apower adapter with interchangable plugs, one of
which
fits the VX-1R. The adapter has three voltage ranges (3v, 4.5v, and 6v, if
memory serves me correctly). Price is about $22 or so.
So, you can charge your VX-1R, then switch and run your Walkman CD player
while chatting on the loca; repeater.
I'm sorry that I do not have the RS part number, but be careful, they have
two
adapters with the interchangable plugs. This one is the more expensive one,
but also has the higher output capacity.
An alternative for those who don't want to pay Yaesu's prices or have the
desire to homebrew one.
I have one for my VX-1R and it works great. The flexibility has come in
ahndy
with the kids electronic stuff as will.

Subject: ICOM IC-706 MKII G The Shame of it
Gang: The ability to work 440 mobile SSB is not the relevant point; its
Icom's lack of "User" loyalty that has me SLIGHTLY upset. My contact in
Japan
has indicated to me that ICOM had the IC-706 MK II G on the planing board
way
back in early January (way before Dayton and the FT-100 announcement)
In fact he indicated to me that the main reason that the FREE UT-106 that
was
offered back then was not delivered until some time in August,, was due to
the
fact that ICOM Japan had made the plan to replace the Mark II with the G
model
back in February 98.
Icom USA Marketing was not Abel to find a way of squirming out of the
freebee offer, it was costing them a lot of Yen to unload the Mark II.
It is my understanding that as word of the delays in delivery of the head
cabel and the DSP unit spread on the User News groups sales of the Mark II
went DOWN and DOWN , giving ICOM even more and more units in INVENTORY.
Now starting again in June 1 1998 and ending in September 30 1998 ICOM is
offering the $100 on the spot and the "Free" UT-106, and like a Dummy I
went
for it thinking that the shipping delays where over .
Now with the new knowledge of the G model in the light of day it looks
like

ICOM IS HOLDING A FIRE Sale, but its not letting us know it.Hi Hi,,,
It gets me VERY upset when I see manufacturers like ICOM who have
complained
for the longest time Years in fact, that we Hams have no BRAND loyalty's
stick it to us with this type of UNDERHANDED actions. As a matter of fact
just look at the September ICOM Adds in any of the magazines, everything
is
hunky-dory, and the price of the IC-706-Mark II that I purchased in July
has
plummeted $300-$400 In my Opinion its beginning to look like the (Far
East)Ham rigs are beginning to depreciate as Fast and Far as Computers. I
purchased The Mark II as a replacement for an older mobile Rig that was
retired , I had Plans to replace my 10-year-old base Rig with at that time
an
ICOM IC-746. NOW I think I will hold off that decision for a wile and even
then I do not think that it will be an ICOM, at least my OLD KENWOOD has
held
its value for the 10 years that I have had it. Just because the Far East is
having an economic depression the manufacturers should not use it as an
excuse. If they want us to have BRAND Loyalty then they must have some USER
loyalty and provide some form of UPGRADE if the User wants it, and I do not
mean a $1200 upgrade.. Hi HI.

Subject: ICOM IC-706 MKII G The Shame of it
Exactly. From the other side of the coin, if there was something
wrong with the radio you have now or you've "outgrown" it, would you
rather the manufacturer NOT bring out a newer model that address the
problems? If you can't afford it, that's your problem. If you can
afford it, then there's no problem. Either way, the manufacturer
doesn't have a problem.

Subject: NDi 2 Metre fm Tranceiver.
I recently purchased a 2 metre tranceiver at a radio rally . The rig is an
NDi.
My question is if anyone has heard of this make? It is a solid well built
mobile,
model hc-1400,a little bulky by modern mobile standards and built possibly
for the American market. Any info gratefully received.
Thanks,
John. de G0WQA.

Bill that is an idiots view of the situation. Over simplifying. You would be upset if that $30,000 car you bought was already being replaced by a better model at the factory with more options etc.. and the dealer didn't tell you that you were buying a discontinued model right off the floor. If he told you this it is a whole different story. The point is being informed when making your purchase.

2712. IC-706 MKII G --- stop whining!

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-27 00:00:00 UTC
From: cslc82@email.mot.com
Message-ID: <35e7d10f.96114064@netnews.worldnet.att.net>
Source record: 133730

AMEN!

Hey, we all like having the latest and greatest, but with technology changing so rapidly these days, any techno gear we buy is doomed to obsolesence (radios, computers, cameras, video, cars, stereo, etc., etc.).

The manufacturers are in buinsess to make profit....and in the process try to keep their customers happy and loyal....but they are entitled to (in fact we the consumers DEMAND they) constantly make improvements and make today's purchase less desireable than tomorrow's.

All this whining about Icom screwing the loyal users is silly. If you want the latest bells & whistles, bring money. If you want your radios to never be obsolete, bring money. If you expect a manufacturer to support legacy equipment forever, prepare for them to go out of business. Like it or not, that's what today's highly technology competitive markets are like.

Me, I just bought a used IC706 for $700 a month ago. I could kick myself with 20-20 hindsight, but it's still a good radio. I am tempted to go for the new Yeasu or the new "G" model Icom, but to do so I guess I'll just have to take the depreciation quicker. Or live with what I bought in the first place. And it'll only be the latest and greatest for a year anyway.

Hello all and thanks for reading this.

About 4-5 years ago I bought the MFJ 1278B TNC. All but the
SSTV were excellent.

The SSTV was terrible with a real blocky look.

Since then I have not used it for SSTV.

Today I was reading the Feb '98' issue of QST and it made
mention of a new software pachage put out by MFJ called
'Multi'Com for Windows (1289W).

Would someone please tell me if the SSTV on this new
software gives a better picture or not.

It would cost about $120 NZ dollars to buy so for a disabled
person like myself I have to be sure that the SSTV side of it is up
to scratch.

Thanking you all in advance Jim (ZL2BMH)

I have a NOS Yaesu FT-101ZD (WARC) in the box for sale.
This radio is NEW and never been plugged in. I'm
asking $525.00 firm. If you're a 101 fan, this is most likely
your only opportunity to find a new one. This is a pick-up
in Sacramento, Ca only, as I want the buyer to see the radio
before he/she pays for it.

If you're interested, please contact: w6jcw@juno.com

Thanks...Bob...W6JCW

Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.antenna

Hi,
Then, one got tired of CB or somehow got interested in ham radio for
whatever motivation was, s/he passes a few multiple choice questions
test by memorizing or randomly picking answers with little bit of luck.
And then go out in a hurry to buy a
HT maybe from R.S. and start yakking on it. And then after a while,
he want some more, Boo Hoo, I want to go on to HF and pollute the
spectrum globally instead of locally w/o knowing almot nothing how
radios work or to cut a simple dipole antenna. End result? ham radio is
dead.
and manufacturers made lots of money making half-perfect products.
Who cares they don't even know darn thing about radios anyway. All they
care is how many bells and whistles it has and just keep buying newer
ones. They don't even know how to use all the bells and whistles
they've got. Sad thing is most of those manufacturers are from JA land.
I cut off sub. to CQ a long time ago. Nothing worthy to read in it
anyhow. I'll be long gone B4 the total demise of our hobby as
it has been known. If I happen to be still here, I'll live with memory
from the good old days. Just browse any NG, questions we are
encountering is such
an amazing level of ignorance or laziness maybe? I heard a guy was
really upset
because he didn't get a job as a PC tech. at a local store. Owner told
me he did not
even know what IRQ was and he got real mad when the interview was
terminated without
offering him a job.
I often wonder if we're still dealing with vacuum tubes, how many new
hams would have been dead daily from being electrocuted. Thank god we're
in low D.C. powered solid
state era! Still one can get a R.F. burn!!

> Has anyone tried out the MAHA ones that supposedly will recharge most
> anything?

The maha MH-C777a universal conditioner/charger is the most intelligent charger available under $500.00.

It retails for $49.95.

it will accept most any NiCd or NiMH pack we can throw at it...NO cups or anything else to purchase. (Well, except a $4.00 test lead set, which can be handy in really weird situations...) It even comes with a 12VDC card cord.

It will properly discharge packs if desired...it detects -dV and dT readings...it has a temperature sensor to keep track of the pack's temp, and adjust its charging syscle accordingly...it will support 4.8V - to - 12V packs...

It takes all the guesswork out of properly caring for your packs. Another invaluable resource is the book, "Batteries in a Portable World" by Isidor Buchmann of Cadex Electronics. Let me find the mini-review I wrote on the MH-C777a and post it here again, and I will send you some "battery care" info via private email.

The CTCSS tone scan on my IC207H quite frequently doesn't stop on a signal
which I know has CTCSS on it. Mostly this happens with commercial freq's
but also on some amateur repeater's/radio's.
I assume that the level on the tx signal is not high enough for the CTCSS
scan function to work on the receiver.

> Anyone seen a good comparison of Akaline, NICAD and NIMH AA batteries - ie
> typical voltages, AH capacity, etc?

Alkalines will probably give you the most A/H (or MAH) and of course a slightly higher voltage than NiCads or NIMH.

Nicad (AA's) generally come in two varietys. Standard capacity which runs around 500 ma to 600 ma and the high capacity which is about 850 ma.
If you use NiCads, I recommend the latter, even though they are a bit more expensive.

NIHI's are more expensive than NiCads but have about the same capacity as Alkalines, typically 1000-1100 mah. The downside to NiHi's are their shelflife. The lose their charge VERY quickly as compared to NiCads. NiHi's were meant to be charged and used.

Another alternative, is the rechargeable Alkalines. Of course you can't use a drop in charger for them, but they provide the higher voltage, higher mah ratings AND are rechargeable.

Much depends on how you plan on using the radio they are used in.

If you are going to use the radio only occasionally and then for low-medium power for maybe only a few hours at a time, standard capacity Ni-Cads would probably suffice. If you plan on using the radio for extended periods of time (12-16 hours), and/or higher power settings, go for the higher capacity NiCads. If you plan on using the radio for extended periods of time and high power, consider the NiHi's.

If you want the extended usage, high power, but only use the radio occasionally and don't mind the hassle of pulling batteries out of a battery pack and charging them occasionally, I would use the Ray-O-Vac Renewal Alkalines.

2736. Fixing PLL on HTX-202

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-27 00:00:00 UTC
From: jpoulin@honk.org
Message-ID: <6s3nfc$835$1@nnrp1.dejanews.com>
Source record: 133754

I would really like to get to the bottom of an onging
problem with the HTX-202 Radios, that many people are
experiencing.

The error "ER2" normaly displays when the PLL curcuit
becomes unlocked.

Now my HTX-202 displays ER2 in receive mode. The minute
I turn on the radio BANG! .. ER2

I called Radio Shack, and they said to bring it in for
servicing, however the service centre in eastern Canada is
backlogged, and I dont want to wait.

Does anyone know how to reset the PLL curcuit on this
radio ?

I have tried the CPU reset (Function-CLR) during POWER-UP
but it did not help.

I would much rather do a quick fix, rather than sending
it to RS.

Any help would be greatly appreciated.

Source record: 133755

I agree with you Bill. I bought the boards to put together a computer that was up to date in Jan this year. Less than 3 months later, the $ 200 drive I bought was selling for $ 150 and the main processor had dropped about the same. Something I knew was going to happen, but I needed or wanted to upgrade the computer I was using.

About the only thing about Icom that I don't like were the models that had the memory module that had a battery to store the main functions. If that <make that when> the battery goes dead, your radio is worthless until you send the module back for reprogramming. That was a bad choice by Icom, but The new models coming out is just good business. Just as a new car comes out every year.

I don't remember exectally where they are, but seems to me there are 3 coils in the front end that can be tweeked about 1/2 to 1 turn that will improve the sensitivity a bunch outside the band with out giving up too much sensitivity in the ham band. Did this on one not long after they came out, but that was a long time ago.

How long is the MFJ-1716S?

On Fri, 28 Aug 98 02:50:34 GMT, Jeff <jeffj@scott.net> wrote:

>I finally have an antenna for my FT50R with which I am happy. I received today from MFJ, their part numbet MFJ-1716S. It's a SMA mount HT antenna that looks great and performs just as well. I have a Comet SMA-3 that although has great performance is a bit too long for my liking. The Comet also developed a "memory" situation where the whip is permentally bent to one side. I tried a Diamond SRH-519, but in order for the SMA center conductor to make contact with the connector on the FT50, I had to actually grind away the base of the SMA connector on a grindingwheel, by grinding about 1/16" to 3/32" off I finally fixed the antenna. The Diamond is a good performance, but the whip (I know this sounds crazy) was actually so thin and flexible that I didn't like it, so I gave it to my brother. The MFJ I got today, is flexible, but firm, not too long and looks absolutely great. The base is the same diameter of that on the FT50 (it doesn't have the rubber skirt). Mfj also overs a 1 year "No
>Matt
>er What" guarantee so even if this antenna should some how fail they will repair or replace it. It's a no lose situation. The antenna cost approx $20.00. It's not listed on their website, but if you call them and ask for a MFJ-1716S they will fix you right up!

>them! The secret with them is not to run them completely down. They like
>to be charged frequently. I get 50 to 60 charges or more and can run them
>down until the radio quits and recharge them without any problems.

Rechargeable alkalines do have higher internal resistance than the
single-use types. Even when freshly charged, the voltage drops more
during high-power transmit, where the HT may be drawing almost 2 A
from the battery pack. This means that RF output power may be
somewhat reduced. How much depends on the radio. Whether the
power loss is noticeable depends on circumstances - usually it won't be.

Rechargeable alkalines also just have lower capacity than disposable
ones, even on their first use. So you'll get less operating time
with them.

So, as usual, it depends on what you are doing. If you have an
alkaline battery pack just for emergencies, but don't normally use it,
throwaway alkalines are a good choice - they'll have more capacity
than rechargeable alkalines. Lithium AA's might be even better -
longer shelf life, better low-temperature performance - but they're
very expensive.

For regular use, definitely use some sort of rechargeable cells.

I do have rechargeable alkalines, and use them for many lower-drain
electronic devices: GPS, flashlights, cassette recorder, portable
radio. But for my HTs, the regular battery packs are NiCd and the
emergency packs are loaded with single-use alkalines.

Dave

Hi,
I've read some good and also very bad news about the new AOR scanner
ar8200 (it should be worst then ar8k?). However this is confusing
and therefore any opinion and suggestion would be very appreciated.
There is also Icom IC R10 ? If I missed something please let me know.
Thank you very much for the help and any information.

Would it be different if Icom simply changed the model number and and call it an
IC-707
or maby a 708? As far as I'm concerned it's a new radio with new technology.

By the way, I don't think a paint job is a good analogy. Does that mean you be
pissed if Icom
offered the 706 MkII in blue?

There's also the factor of price in addition to increased performance or features. What everyone seems to have missed is that the Icom Mk II G may not replace the Mk II but come in as an enhanced model above it.

In fact, according to Gary Fibre on ICOM's CompuServe board, the Mk II G is expected to be at $1600 street price and the Mk II will remain in the product line-up at the current price, about $1200-1300 street price. If you compare the II G against the 746, then you get a bigger display screen and built in DSP for another $200-250, while the Mk II G is more portable.

I don't know about you, Gary, but to me twelve hundred dollar electronic items are not "throw aways" in the same sense as a $300 27" stereo television or a $100 four-head VCR.

The "improvements" everyone alludes to are not technology driven, they're general goof ups during design and are passed off as improvements by the marketing gang. Make the product right the first time so you don't leave your customers with six month old orphans that they can barely give away. That is what some of us are alluding to, not whining because new models are coming out. Those complaining about whiners sound like pimple-faced teens whose daddies or mommies buy them everything.

How much less expensive would a new car be if they ran the same well designed models for five years? At my age, all of the modern cars look like something from a Rod Serling nightmare movie, so to try to sell me a new car on appearance is useless. Especially if the previous model had lots of bugs because of lack of effort. The new model will too when designed by the same people. So why buy a new one?

I appreciate value, reliability and performance in areas that matter to me. The current crop of radios have tons of little bells and whistles that are of no consequence to me during my use of an amateur radio. Yes, I am aware of the fact that the "features" are microprocessor based and that they would be there anyway. Not my problem. Irrelevant to my buying decision. Perception is what the public buys. Not engineering rationale.

My point being that if they are going to continue to produce throw away amateur rigs, at least drop the prices down into the throw away region. Japan is in the process of getting their collective asses kicked the same way they kicked our asses a few years back. That's why the desperate measures - ethics be damned - attitude. It couldn't happen to a finer lot.

Just think, there's some guy in India or Bangladesh scraping enough capital together at this very moment to build a new electronics super factory that will break Japan's stranglehold on the amateur radio market. I can hardly wait! Where can I order that new $300 all band, all mode Patel 6000? F@#k Icom.

I have the following equipment for sale:

1. Kenwood TS-430S HF Transceiver with:
1.6 Khz AM filter installed (great for SWL!)
MC-43S hand mic
Users Manual
Service Manual

In excellent working condition and cosmetically
an 8.5 out of 10.

2. Astron RS-20A 13.8V 20 amp power supply in excellent
working and cosmetic condition.

3. MFJ-941D VersaTuner 300W HF Antenna Tuner
1 Balanced and 2 unbalanced feeds
SWR/Power meter
In excellent working condition.

Would like to sell together for $650 but will entertain
individual offers if no one takes the package. All prices
include shipping to continental US only. Payment to be
made by cashiers check or money order, no COD.

Andy, you underestimate thecapacity of alkalines. 1100mAh is the
rating of AAA size cells. The consumer AA Duracell is rated at 2.6Ah
(2600mAh) and their ProCell industrial product is rated at 2.7Ah.

Tony does the capacity of these Alkalines vary depending on the current drain? If I have a 1mA load on the cell, or a 1A load on the cell, does it's Ah rating vary?

2766. Re: Repeater duplexer HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-28 00:00:00 UTC
From: Donald Labriola <labriola@ix.netcom.com>
Message-ID: <35E71479.D7B18429@ix.netcom.com>
Source record: 133584

Excellent comments. Had one more to pass along. Try transmitting with a different transmitter and see if the receiver characteristics change. We had a commerial repeater that used an internal processor to do the various timeout, synthizer initialization, and other house keeping tasks. When we looked inside the box, this had been implemented on a 2 sided PCB with out any extra shielding around it. We tracked the noise on our input to EMI from the internal processor mixing into the output stage. We were using an external repeater controller, so the only function that the onboard computer was doing was setting up the synthizers, so we added a power on monostable that only let the processor run for about 4 seconds before putting it into the reset state. This cleared up the remaining problem we were observing. BTW, we also had guy wire noise in dry weather that also only was apparent when the TX was operating. It was happening between the wire and an eyebolt. We had to make hard connections between all items near the antenna or we had to insulate them properly to remove the problem. This included electrically tying the parts of the turnbuckles together!

Good hunting!

dgf@netcom.com (David Feldman) writes:
>Tony does the capacity of these Alkalines vary depending on the current
>drain? If I have a 1mA load on the cell, or a 1A load on the cell, does
>it's Ah rating vary?

Capacity is measured as the amount of energy you can get out of a cell before the terminal voltage drops below a certain threshold. The number depends on both the discharge rate and the cutoff voltage you select.

Duracell rates their current AA alkalines at 2.85 Ah with a load of 43 ohms and a cutoff voltage of 0.8 V. So the discharge current is 35 mA to start with, dropping to about 19 mA at end of measurement. A 1 mA load would give you a bit more capacity yet, a 1 A load would give you much less capacity. At 1 V cutoff voltage, you'd get somewhat less capacity, while with a cutoff of 0.7 V you'd get a little more.

Yin,
Wake up and smell the Coffee
The ICOM has started the Fire Sale on the MKII Now
Most of the Peddlers are selling the MKII for $975+- $25
this with the famous $200 iBOM INSTANT Discount cupon and as I stated
in the Past THE FMOUS FREE DSP (UT-106) that you may get in 1999 if
you are lucky.
Lets be realistic Yin, Gary is a nice guy, but he takes orders from a
Higher Source and is only stating the "company man" position.
Lets see if the Big Kahuna in ICOM America has the Intestinal
Fortitude to come out from behind the curtain and make a STATMENT on
the record.

2780. FS...Hallicrafters SX-101 MARK 3 Ham Receiver

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-28 00:00:00 UTC
From: DA Honeycutt <k3458@leo.infi.net>
Message-ID: <35E74E0D.70E0674E@leo.infi.net>
Source record: 133598
Cross-posted to: rec.radio.amateur.boatanchors,rec.audio.tubes,rec.antiques.radio+phono,rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.swap

I have for sale a Hallicrafters SX-101 Mark 3. This one is a great example of Hallicraftersï¿½ first receiver produced to exclusively cover the Ham bands. Covers 160 thru 10 meters, 14 tubes, dual conversion, crystal calibrator, S-meter, selectable sideband, ANL, BFO, and Notch filter. This SX-101 MARK 3 is in beautiful cosmetic and operational condition, chassis is very clean. Less than normal top scratches, faceplate is beautiful. Tuning knob has two small chips in the outer rim, otherwise, front panel appearance is near perfect. Overall, I rate 9.5+. With original ownerï¿½s manual. This receiver is very heavy, approximately 75 pounds. Guaranteed not DOA, otherwise sold "as-is". No warranty implied.

This receiver is not for bid at eBay Auction, I am selling it direct. I

am asking $275 for the receiver, but feel free to make an offer. To see

several photos of the SX-101, please follow these links:

http://mh102.infi.net/~k3458/index.html/front3a.jpg

http://mh102.infi.net/~k3458/index.html/chas2a.jpg

http://mh102.infi.net/~k3458/index.html/close.jpg

Note: yellowing in photo along edge of faceplate is a camera problem, not actually on the receiver.

Please email me to make an offer.

Thank you,
David

Your message makes me want to buy both of them too!
Other alternative is just to buy extra battery packs and put up with long recharging cycles.
The idea of something that will look after all kinds of batteries is very attractive.

I have been following this for a while, tuning of the hybrid ring is
critical. By changing the cable harness you may have shifted the phase
cancellation in the ring to move out of spec. ie. different velosity
factors for cable manufatures can be one cause which will allow signal
to now pass into the receiver leg of the hybrid. One fix which will
bring you up to current day duplexer standards is to check and see if
the holes in the cavities are 1.25" if so order a set of "Q" loops from
Sinclair and make a new harness. This will make it a Bandpass/reject
duplexer and you will be sure to get your isolation. I can provide you
with the harness length information if you like.

2784. FS: Yaesu FT-8100r

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-28 00:00:00 UTC
From: "Glenn E. Frasier" <gf1@airmail.net>
Message-ID: <B6CD8781825F392F.2264D4C1D1C4A5EE.005AC9F0FA84E842@library-proxy.airnews.net>
Source record: 133602

I also have a FT-8100r that is 7 months old that I need to sell. It is in perfect working condition. It has been used as a base in my shack.

I need $375 for it.
have programing software and cable with radio.

The Yaesu FT-8100 is a compact 2m and
70cm dual band FM mobile transceiver. The
radio has an amber "Omni-Glow" LCD display
with illuminated front panel controls, which can
be removed for remote mounting with the
optional YSK-8100 separation kit.. It features
AM receive, extended VHF receive, extended
UHF receive, plus 750-1300 MHz coverage
(cellular and cordless phone frequencies are
blocked), 110 full function memory channels
(55 memory channels per band), CTCSS tone
encode, optional CTCSS tone decode, full crossband duplex, dual receive,
dual in-band receive (VHF or
UHF on both receivers), direct DC voltage display, built-in antenna
duplexer (one antenna jack), DTMF
autodialer, dedicated 1200 and 9600 baud packet radio connection on rear
panel, selectable RF power
output control, multiple scanning modes, and more. The radio is
manufactured to meet MIL-standard 810
rating, and can be programmed with the optional ADMS-2 Windows software.
The radio is supplied with a
backlit DTMF microphone with up and down frequency controls, a mobile
mounting bracket with hardware,
and a fused DC power cord.

Technical Specifications
VHF RX coverage..... 110 550 MHz
UHF RX coverage..... 750-1300 MHz
sensitivity..... .18 V
RF output..... 50 / 35 watts
input voltage..... 13.8 vDC
current consumption..... 11.5 amps
dimensions..... 1.6" H x 5.6" W x 6" D
weight..... 2.2 pounds

2785. FS: Icom 746 2 months old

Newsgroup: rec.radio.amateur.equipment

I have a Icon 746 that I need to sell. I love the Radio but need money more
that the rig right now. It is only 2 months old and was never used on HF
only 6m and 2m.

I am asking $1,500

I also have the CI-V computer interface I will put with the radio.

The new ICOM IC-746 is an HF, 6m and 2m all mode
transceiver with a quad conversion superheterodyne general
coverage receive. The radio has a blue, dot matrix LCD display
with spectrum scope function, and features 100 watts of RF
output on all bands, selectable automatic peak filter, automatic
antenna tuner (covers HF-6m), CI-V computer interface, CW
Memory Keyer (4 memories, 3 filter slots (2 n the seconf IF lever,
1 in the first), QSO serial number generator and auto repeat
message), adjustable CW pitch (300-900 kHz), FM narrow
mode, IF level Digital Signal Processing, 100 memory channels,
10 "Memo Pad" memories, noise blanker, 2 step preamplifier, full
break-in (QSK), transmit audio monitor, triple band stacking
registers, twin passband tuning, VOX, and more!

The DSP unit offers noise reduction, noise blanker, automatic
notch filter, and bandpass filters, and more.

Technical Specifications
RX coverage..... 30 kHz-200 MHz
sensitivity..... <.16 uV
selectivity..... 12, 9, 2.1 kHz
IFs..... 4 (3 in FM)
RF output..... 100 watts
input voltage..... 13.8 vDC
current consumption..... 20 amps
dimensions..... 4.8"H x 11.3"W x 12.5"D
weight..... 20 pounds

This guy complains about what folks say incorrectly on a radio -- then uses
the f--- symbol? And may we ask what JANAP manual that one came from?
How often do you use f--- on the air? You might as well say ". . . All them
threes an' good stuff at ya -- we Gone. . ."

Looks like I will be taking delivery on five or so spectra A9 450-482 mhz trunk mount radios. Will apparently go to around 441 mhz with current programming software (not 'SP' or lab software)- which I don't sell. Units will be in good condition (not perfect but good) and tested with all accessories. Should be ready late next week.

$750 each or $3500 for lot of five. Prepaid but includes shipping if sold at these prices.

I will also entertain trades for lated model commercial/government/military receivers from Watkins-Johnson, Harris, Racal, Norlin, Cubic, etc....

You can now buy Japanese made 1000mA/H AA size NiCads. You get all the
advantages of Nicads without losing too much capacity in comparison to
NiHI versions.
>
> NIHI's are more expensive than NiCads but have about the same capacity
> as Alkalines, typically 1000-1100 mah. The downside to NiHi's are their shelflife. The lose their charge VERY quickly as compared to
NiCads. NiHi's were meant to be charged and used.....

If you have a computer with a sound card you can get into SSTV for less money than that. There are at least two good programs for WIN3.1 or WIN95 using a sound blaster or equivalent card. They will also key your rig through the serial port. Both work quite well, and the price to register them is less than the4 cost of the MFJ software.

GEE - I've used the Ray-O-Vac rechargable alkalines for over 3 years now in HT's at all power settings and have had nothing but the best of luck with them! The secret with them is not to run them completely down. They like to be charged frequently. I get 50 to 60 charges or more and can run them down until the radio quits and recharge them without any problems.

I still have the plain old original 706, and am still amazed by this small radio!

You can't blame Icom for keeping new models a secret.
If they let the cat out of the bag, the dealers would be stuck with the old moddle that no one would want to buy, without deep discounts.
The 706 MKII, is deeply discounted now, I would imagine to sell out before the next model comes out.

In the case of the Yaesu FT 100, they are hopeing that people will hold off buying a 706, and wait for the FT 100.

2800. FT50 Antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-28 00:00:00 UTC
From: Jeff <jeffj@scott.net>
Message-ID: <PNR603083559y@scott.net>
Source record: 133680

I finally have an antenna for my FT50R with which I am happy. I received today from MFJ, their part numbet MFJ-1716S. It's a SMA mount HT antenna that looks great and performs just as well. I have a Comet SMA-3 that although has great performance is a bit too long for my liking. The Comet also developed a "memory" situation where the whip is permentally bent to one side. I tried a Diamond SRH-519, but in order for the SMA center conductor to make contact with the connector on the FT50, I had to actually grind away the base of the SMA connector on a grindingwheel, by grinding about 1/16" to 3/32" off I finally fixed the antenna. The Diamond is a good performance, but the whip (I know this sounds crazy) was actually so thin and flexible that I didn't like it, so I gave it to my brother. The MFJ I got today, is flexible, but firm, not too long and looks absolutely great. The base is the same diameter of that on the FT50 (it doesn't have the rubber skirt). Mfj also overs a 1 year "No Matt
er What" guarantee so even if this antenna should some how fail they will repair or replace it. It's a no lose situation. The antenna cost approx $20.00. It's not listed on their website, but if you call them and ask for a MFJ-1716S they will fix you right up!

2802. Ever wonder why it was not called "73s Magazine"??

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-28 00:00:00 UTC
From: ljrockford@aol.com
Message-ID: <1998082804414700.AAA09075@ladder03.news.aol.com>
Source record: 133682

Just in case you haven't, it is because there is no such thing as 73s. The term "73" means best regards. Therefore, "73s" means best regardses! By using the terms "73s", "73rds" or "73's" you are showing your ignorance. I know that some of you feel it is correct to say "73s" to a group. But, I submit that such usage probably gave root to the use of the incorrect plural form in the first place. So, just say "73 to all" - it really isn't that difficult to use these terms correctly!!

Thus, the reason "73 Magazine" was so named is because "73" is the correct form of the term and even Wayne Green knew that way back when . . .

Now, while I am on the subject, what the f--- is a "guide wire" or a "guyed wire"???? Since both are incorrect, I don't have any idea how to spell it/them! Additionally, how do you think this got started? It's kinda like using a term that was popular (among those who were just ignorant enough to use it) back in the Eighties - "satellite disk." By definition, a disk is flat not parabolic. Kinda hard to focus something when the focal length is infinite!!! By the way, you support (or guy) a tower with guy wires . . . not guide or guyed wires.

The point of all this is to demonstrate how our hobby has been bastardized by a bunch of ignorant smucks. I want to take it back. From this day forward I will correct anyone I see or hear using incorrect versions of "73" - I will do so politely but firmly. Will you do the same?

2803. Re: ICOM IC-706 MKII G The Shame of it

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-28 00:00:00 UTC
From: jhulet@aol.com
Message-ID: <1998082804473100.AAA09770@ladder03.news.aol.com>
Source record: 133683

Hello all,

I purchased an ICOM 706MKII before there was even mention of a DSP unit for it. So I missed out on the DSP as well...

I think what owners of "MKIIs" are upset about is that this notion of "new" technology in ICOM radios. ICOMS technology for their radios aren't created in a matter of months.

ICOM could have come out with the MKIIGs from day one and given all of us all the goodies from the start. Thats what makes MKII owners upset. How long does one have to wait to be "sure" that ICOM isn't holding back another feature on one of their radios???

Its like Toyota coming out with a wonderful sedan, but it only comes in a rusty brown color. But you really like the way it drives so you spend the premium cash and buy it. Then 3 months later Toyota announces that it will now offer this really nice sedan in "blue." You are a little mitfed but Toyota is offering an "upgrade" paint job for $150 bucks,so you bite the bullet, and you order the paint job but have to wait 9 months to have Toyota do the work. So 9 months later you have your nice "Blue" Toyota sedan, you feel you paid a premium price for the extra paint job but you feel that now the market value is equal with the Toyota sedan owners that got the Blue paint job for "free*." Then lo and behold Toyota announces that they will now offer"Red" paint with their new "sedan." To top it off the sedan which now comes in Rusty brown, Blue and now Red is hundreds of dollars cheaper then what you paid for your rusty brown sedan 12 months ago after your upgrade...!!! Now does this sound like new found "technology" or does this sound like a marketing rip-off??? The 706MKIIG isn't a hot off the press "new" radio, it just has (maybe) most of ICOMS technology put into it. You be the judge, as for me ICOM has put a sour taste in my mouth.

No doubt the one is switch-mode design while the other is standard PSU (i.e. large heavy transformer, capacitor etc.). Beware of switch mode devices, some (not all) have extremely bad radiation which affects HF reception, but if it is being sold by a radio dealer then he is probably aware of the consequences.

>Hey, all. just picked up an icom 3sat 220 rig. my question is, anyone have a
>manual I could have or copy?
>
>And, how do you program the darn PL tones?

PL requires an accessory board that isn't standard, so you may not have it.
To check, hold the Function button (above the PTT button) and press the #1
(T/T SQL) button. Watch the display in the top center for a T, then a T
SQL to toggle on/off. If it does, you have the accessory board. "T" means
encode, and T SQL is encode/decode.

To program a tone, hold the F key and press the #8(SET) key, and let go.
You're now in the SET menu, which has about 7 parameters it adjusts. One
of them is the tone frequency. Scroll through the menu options until you
see "TO" on the right, and a PL looking frequency on the left. Then rotate
the "channel" knob on top of the radio to select the frequency.

Other SET menu items are:

OW - offset, defualts to 1.6 MHz
TS - tuning step, defaults to 5 kHz, but you may want to change it to 20
kHz.
PA - lower VFO scan limit
PB - upper VFO scan limit
BE - beep on/off (beeps when keys are pressed)
PS - Power Save on/off
TO - adjust PL tone frequency

I can copy my manual - no charge, if you send an 8-1/2x11 envelope with 2
oz. first class postage, to my callbook address. Put a note on it saying
you want the 3SAT manual.

Wow LJR, sounds like those things really bug you. I've heard or seen a few more that should get right in your nerves also.

When you e-mail someone and you type something that you think is funny and you put hi hi at the end of the line.

Q signs in e-mail OR spoken over the radio.

When you should say 'Excuse me" or "I'm sorry" but instead you say "My bad."

Using non-standard words in spelling out things over the radio. A=Alpha, not America...

Now we've started it LJR, this thread can go on for years about things that bug us.

Oh well,

73s...hi hi
Oh, my bad...

>> the correct address.
>>
One way I've used to confirm that the channel has digitally coded
squelch is to set my receiver CTCSS tone to 136.5 Hz, then make sure
the carrier squelch control is rotated open.

Since DCS sends a burst of 136 Hz at the end of each transmission
(well, all but the old Moxy's do) you can hear your radio open up
with a noise burst every time someone lets go of their PTT.

You won't hear the messages, of course, but you'll confirm that DCS
is being used.

Steve:

Thank you for your kind words!

Good thought. Is the goal to encourage more Advanced and Extras to
choose to become part of the VE system?

I think the FCC plans to add Generals to the VE pool, so we should
probably add the VE questions to their exam as well.

LJR-

Of course you are correct. A tower that has guy wires is said to be
"guyed", as opposed to one that is "self supporting".

As far as correcting missuse of terms like 73, it is like spitting in the
ocean. Most people like to play the game the way others play it. Since
most of their peers say "73s", they really don't want to hear the truth,
and won't change if corrected!

All each of us can do is set our lonely example.

I have a 100W HF rig in my Legacy Outback, no problem. I mounted
the antennas on the back of the car, 2 on the roof, one on
the trailer hitch. The only problem was some interference
from the car to the radio on 40M, but it really helped when I grounded
the muffler. I wired the power direct to the battery, fusing
both power and ground right at the battery. (Yes, you should
fuse ground, but you have to analyse what happens if the ground
strap to the engine fails to understand why.)

If you are running lower power on 2M, I would expect no
problems. If you go for more than 30 watts or so,
I would wire the power direct to the battery. A good
installation (especially good grounding) will minimize
problems.

2831. 42-Volt Vehicles Coming

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-29 00:00:00 UTC
From: Michael <moreth@ix.netcom.com>
Message-ID: <35E878E9.5D30@ix.netcom.com>
Source record: 133461

42-Volt Vehicles Coming

U.S. and European automakers have agreed to increase vehicle voltage to 42-volts in 2002.

The agreement calls for a 36-/42-volt standard that triples the current voltage battery output (12 to 36) and generator output (14 to 42).

"Automotive Industries" reports in the August, 1998 issue that a 12-volt and 36-volt dual battery system is the most likely solution. The 36-volt starting battery will be roughly the same size as a typical 12-volt battery. The reserve 12-volt battery will be similar in size to a motorcycle battery that can be placed anywhere in the car.

Automakers expect the higher voltage to help cut weight, improve vehicle efficiency, and increase the use of advanced technologies.

have you all taken a close look at bothe radios?? They are so similar
in apparence and specifications that I would bet my button that they
came out of the same factory or the same engineering orginization.
With the Japan yen like it is, I would not be surprised if they have
not merged several functions. Any comments on this??

>RS is most certainly no charity, it's a business that makes money of their
>advertisement.

Advertisement? Those catalogs are produced for the benefit of the
salespeople. It is a reference guide and a training tool. RadioShack is kind
enough to provide them to customers that also find them helpful.

>We don't have to have any pity with RS that it costs them
>money to print the catalogs, they sure earn it back. If this type of
>advertisement would not be cost effective to them then they would not have
>catalogs.

The monthly mailout that is targeted to customers who volunteer their names
and addresses are significantly more effective advertising than the catalog.
A few years back the elimination of the RadioShack catalog was discussed.
Instead someone thought of the idea of selling the catalog on newstands (I
noticed that they were for sale at Wal-Mart). This is when RadioShack
started selling the catalog. The first year the catalog had coupons in it to
compensate for the customer's investment. The first year (four years ago)
was the only year that RadioShack charged for the catalog at the RadioShack
store. After that they have a policy that the exchange of name and address
information for the mailing list was a fair price for the catalog.

>I guess it's as with many things that we've become to accept these
>things and think it's normal. It's like telemarketers who call collect, I
>guess one day we'll think that's normal too. If they would use the money to
>plant trees that had to come down to make the catalog, then I would be
>willing to pay.

Use what money to plant trees? The money that they earn from the sale of the
catalogs? They don't make any money directly from the sale of catalogs. In
fact the costs of the catalog are a lot greater than the profits made from
selling them even if everyone produced were purchased. If you are concerned
for our environment then take your old NiCd batteries to them to be
recycled.

Hi:
I thought that there may be some interest in what functions are in the
new 706. I did a partial translation of what information was on the ICOM
Japan home page.

price 138,000 yen
same physical size as the current model
167 x 58 200 mm
front panel detaches
all PA stages are MOSFET
HF+6m one section
2m +70cm one section
tx/rx sections redesigned
-for better C/N
-for better IMD
-reception
0.03 through 146 MHz
430 through 440 MHz
FM broadcast 76 through 90
air band
TV bands(Japan)
-optional CR-282 TCXO offers 0.25ppm
--> on 430 MHz +/- 0.1kHz
107 memories
supports narrow FM, +/-2.5kHz
supports 4.630 MHz emergency frequency
two antenna outputs
HF/6m
144/430 MHz
stability
1 minute after power on +/- 7ppm
after first minute +/-1ppm per hour
0.25ppm if CR282 is installed
power consumption
13,8V +/- 15%
2A rx
20 A tx
Weight
2,45 Kg
Output
HF/6m 100W
2m 50W
440 20W
Suprious

HF -50 dB or better below 50 MHz
-60 dB or better above 50 MHz
6M/2M/70cm better than -60 dB
carrier suppression 40dB or better

>by SEC rated at 20 and 23 amps. The second one is 3lbs and the first one
>weighs about 18lbs. Both cost $119.95, new.

Don't overlook the option of running your equipment off a 12 volt battery, (lead acid, gell, nicad, etc), and trickle charging it with a small power (cheap) power supply. I've been operating an FT 757, 2M and 440MHz rig off such a setup for decades. An added benefit, when the power goes out, the radios don't.

Source record: 133512

I, for one am extremely thankful that For Hams Only exists. Many times I have dealt with Rob and his staff, and have always been treated fairly and honestly. Before one condems FHO, let's take a look at some basics of the radio business. First, Uniden is not known to be customer friendly, even to their dealers. More often than not, Uniden will accept radios for repair, and simply send out a refurb-not the one you sent in. Quite often, the refurb will have problems. And yes, Uniden will charge excessively for their services. Yaesu and Standard have been known to accept orders on backlog until they have enough to justify a production run...some large dealers will advance purchase a large quantity because of this. FHO is a small shop, and does not have the purchasing clout of an AES or HRO. I cannot speculate on the perceived lack of communication from FHO to you...perhaps your expectations are a tad too high. Rob has taken items I purchased back, and has fronted me some stuff...I don't think AES would do that. Just because a merchant does business with a handshake isn't bad...how do you know what records he does or does not keep??? I'm sorry you had a bad experience, taking it to him for resolution is the proper thing to do. If anything, we need more small businesses willing to cater to the Amateur radio community. The profit margins may be low, but I would prefer to deal with a contemprary instead of impersonal sales clerks so common with AES, HRO, Jun's, Lentin's, and the rest. Rob has been good to his customers, newcomer and Extra alike, a competent resource for the Pittsburgh radio community. Instead of bashing him on the net, why dont't you deal with him in person, as a man would do?? You give me the impression sir, of one who is quick to scream before you have all the facts....if anything, you owe him an apology. You also are guilty of insulting us local hams who patronize Rob....I am not an idiot, and I will tell you so in person, if you aren't in hiding....hope to see you at Butler September 13th.
Sincerely,
Edward Hutton N3KEX

One way I've done it is to put my Yaesu FT-50 into DCS search mode and
"wallah"... there it is!
I hope more of the mfg's will start including DCS on their ham rigs!

Maha also makes a single well drop-in rapid charger just for the FT-50 (mh-101) that will do all the types of FT-50 batts including the NiMi ones, and gives the added benefit of having the "drop-in fully automatic perfect fit" of the yaesu unit. Kendoo products also has a DUAL well drop-in for the FT-50 that does nicad & hydride batteries. Saw them both at Advanced Specialties in NJ (1-800-926-9426 / 201-843-2067) Good luck!!

2855. FS: Yaesu VX-1R power plugs

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-29 00:00:00 UTC
From: jdc@cci.com
Message-ID: <6s7ljk$fbl@bmerhc5e.bnr.ca>
Source record: 133515

For sale: That hard-to-find power plug for Yaesu VX-1R radios.

Price, including first class postage to 50 states and Canada:
1 connector for $3.00
2 connectors for $5.00
3 connectors for $6.50
(add $1.50 for each additional connector)

We also have 7806 regulators for an additional $0.50 each when
you get one or more connectors.

Add wire and a couple bypass caps and you can have a 12-volt
adapter for under 5 bucks. Compare that to the $38+ that Yaesu
wants for their's. (At the Rochester hamfest it was "only" $35.00.)

Send a note saying how many you want along with a check or M.O.

item #27642396. late WE [s/n 46xxx] with RE pto subchassis--a crossover model i reckon. this radio has .8 and 2.4 filters, not a scratch or chip in the front panel, one paint chip on the rack adapter, a little shelf dust on the chassis is all, the knobs paint isn't chipped, the knob inserts do need polishing, and the power cord's a bit dirty but still has the original little green tag. probably a CCA 9 or better, but i'm not sure i fully understand the cca rating system so i've tried to give a comnplete descriptiuon.

2863. is timewave gone? Nu fone #, No answer

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-29 00:00:00 UTC
From: k0rdw1@pipeline.com
Message-ID: <6s8118qmj1@camel15.mindspring.com>
Source record: 133523

On friday Aug 28, 1998 I called Timewave at 651-452-5939. The number was changed to 651-222-4858. This is a downtown St.Paul, MN number. The old number is in Mendota, a suburb of St. Paul. I called the new number though out the day with no answer. I also sent a e-mail, but no response.

On Thusday I called in an order for an upgrade using the old number. I was following up on it on Friday.

Hello Ron,

I think Timewave filed for bankruptcy several weeks ago - it seems they were trying to re-organize instead of going caput. I am sure there are others who are closer to this situation. Perhaps they have the latest scoop and will post it here. Your experience doesn't sound so good but it could also be that they are in the midst of moving from the old location to the new one downtown.

Regards,

Bill

Date: 1998-08-29 00:00:00 UTC
From: jhulet@aol.com
Message-ID: <1998082905212800.BAA27640@ladder03.news.aol.com>
Source record: 133526

The point I was trying to make with the paint job is that the new MKII"G" is not a technology break through, all of its features should have been added when they introduced the radio for the first time.
Accessories in the Ham Radio Hobby is killing the avarage Joe... Stop making us pay for features that should have been encluded in the original model.

I do believe that there were some valid improvements made to the IC-706, when they introduce the MKII. But the introduction of the DSP unit just months AFTER the introduction of the MKII was sick. How could this be new and improved technology when the darned MKIIs have a nice little socket for the DSP?? Rip-Off is why... Why didn't they include the DSPs with the original MKIIs? Hasty way to make some bucks ASAP, and then introduce the DSP for free, like it was supposed to be with the unit all along? That made me sick, $1,250 dollars and now they are giving away this DSP(that sould have come with the radio from the get go) for free and calling it an "accessory." $150 bucks to get what the other buyers are getting for free? Its the SAME radio... time of purchase is the only difference... Why shouldn't the first purchasers of the MKIIs be intitled to the free DSP? And now the "G." Is the 440 band a new technological break through? Do you honestly think that ICOM could not have put the MKIIG out form the beginning? Yes, I have learned a valuable lesson in the Ham Radio buying world. Its just a shame we get played this way.....

Respectively,

Jason S. Hulet

I beleive I had a similar problem when I tried to use a Icom battery.
The positive wire in the battery did not have a decoupling capicitor
on it as did the RS battery. I added a 0.1 mF 50V capicitor between
the center contact on the battery and the mounting rail and this
fixxed mine. The HTX404 added this capicitor inside the radio at near
the same point where the battery connects to the radio. I hope this
helps.

I went to the local Radio Shack here today and bought 2 small items which only came to $7 plus change. After paying for them I noticed the new catalogs and asked for 1. All the clerk did was scan it in and give it to me. NO charge I suspect that if you purchase something even a few $ they will still give away the catalogs free. We all know it costs to print those and some people would take 10 of them if they had a chance. I am not a big RS fan but I do buy a few things there.

LJR, are you hearing 73 (or 73's) on voice or code? If on code, do you not send the character "7," followed by a space, and then the character "3?" Which translates to "seven three" on voice and not "seventy three?" If it were meant to be "seventy three," wouldn't we run the seven and three together (like SK and AR), or beep "TY" between the seven and three? If we are going to get NOID about this, perhaps we should have a big discussion before we start acting like a bunch of Extras here.

Thanks,
Brian/N0iMD

I think it's a rediculous idea that one has to pay for advertisement at all.
RS is most certainly no charity, it's a business that makes money of their
advertisement. We don't have to have any pity with RS that it costs them
money to print the catalogs, they sure earn it back. If this type of
advertisement would not be cost effective to them then they would not have
catalogs. I guess it's as with many things that we've become to accept these
things and think it's normal. It's like telemarketers who call collect, I
guess one day we'll think that's normal too. If they would use the money to
plant trees that had to come down to make the catalog, then I would be
willing to pay.

> I am not a big RS fan but
> I do buy a few things there.

Same here. I bought a cassete player a couple of weeks ago at RS. The thing
costed $19.95 and this girl tried to sell me a waranty for $19.99. She did not
seem to understand that it was a bad deal and kept trying to sell me the
waranty.

I didn't say that it was. When I bought my IC-706, it was a very good value for the money. It offered features in a package size that no one else could offer. I bought it, and don't regret buying it. It has served me well, and continues to serve me well. Now there's a newer model with even more features in the same package size. Am I upset by that? No, of course I'm not. I fully expected that improvements would continue to be made. I had two choices when the IC-706 was introduced. I could wait for a possible Mk II G, or I could buy a radio which allowed me to operate mobile right then. That's the same choice faced by anyone buying anything. If you want a radio, at some point you just have to buy one and stop waiting for a newer thing to come along.

>The "improvements" everyone alludes to are not technology driven, they're general goof ups
>during design and are passed off as improvements by the marketing gang. Make the product
>right the first time so you don't leave your customers with six month old orphans that
>they can barely give away. That is what some of us are alluding to, not whining because
>new models are coming out. Those complaining about whiners sound like pimple-faced teens
>whose daddies or mommies buy them everything.

If the only reason you buy a radio (or any other electronic product) is for the resale value, then of course you're going to be unhappy. I bought my IC-706 to use, and I've been using it now for over two years. I've gotten value for my money. If I'd waited for the Mk II G, I'd still be waiting instead of operating. If I decide I want a radio with 70 cm
included, I may buy a G model, or the new Yaesu, but for now I am content to continue using my original IC-706. It still meets the parameters which caused me to choose it in the first place.

There are no perfect radios. Every radio has design tradeoffs. Some of the tradeoffs of the original IC-706 weren't well considered, and were fixed in the Mk II (and were fixed by me in my IC-706, some of the changes made in the Mk II are carbon copies of changes I posted to the net a year before the Mk II came out). That's to be expected. Radio designers aren't omniscient and omnipotent, they make mistakes, and they can't foresee 100% what will and won't be important to their customers. And they are limited by the amount of time to market they have, and the technology available to them during the design process at the target design cost, as to which features they will include or not include.

As example of the latter, the Mk II was originally intended to be offered with DSP, but the DSP wasn't ready when the Mk II was introduced. They could have held off releasing the radio, and those who would benefit from the other improvements of the Mk II would be denied those benefits, or they could release the radio immediately and offer the DSP as an add-on later when it was ready. That's what they did, and

I consider that reasonable.

The market now seems to want 70 cm included in the radio. So the G model will include it. At the time the IC-706 was designed, that demand wasn't apparent, even adding 2m was a bold step as no other mainstream mobile amateur radio then offered HF through 2m. Adding 70 cm would have increased the cost of the radio above its target cost (we don't know what the G model will cost, thanks to the declining yen it may not cost more today, but it would have then). So they didn't include 70 cm in the first model. The G model will have it, and I consider that a reasonable reaction to changing market expectations.

>How much less expensive would a new car be if they ran the same well designed models for >five years?

Probably not much. Autos are mass produced items, and the overwhelming bulk of the cost of mass produced items is production cost, IE cost of materials, labor, etc. Design costs are amortized very quickly. In fact, design costs which lower cost of production very quickly pay for themselves and result in a lower total cost. (Look at the cost of the Beetle, it went from being one of the cheapest cars to one of the more expensive during its product lifetime. That's because its design stood still while other cars were redesigned to accommodate changing technology and economics. Modern cars are designed for robotic assembly, the Beetle was not. So it couldn't benefit from more modern production methods. Modern cars are designed to use high strength alloys that allow them to be lighter and cheaper to produce, the Beetle didn't. Etc.)

>At my age, all of the modern cars look like something from a Rod Serling >nightmare movie, so to try to sell me a new car on appearance is useless. Especially if >the previous model had lots of bugs because of lack of effort. The new model will too when >designed by the same people. So why buy a new one?

Because it beats walking? Sooner or later you have to buy a car. The old ones don't last forever. At some point, trying to keep an old one running is less cost effective than buying a new one. If technology allows the new one to get better gas mileage, be more crashworthy, be more comfortable, or otherwise deliver more value than the older one, then that's a *good* thing. If next year's model will be even better, but you need a car *today*, then too bad. You have to make a purchase sometime, or you'll just have to resign yourself to walking.

Sure, you can buy a used car, but somebody has to be buying new cars for there to be any cars on the used market. As a second tier buyer, you are dependent on the sales success of new cars in order to supply you with a used one. That's the way it works. If new cars are selling well, used cars will be plentiful and cheap because lots of people are trading up, but if new cars aren't selling well, the supply of used cars is less and the prices charged for them is higher. That's how a free market works. The same thing happens, at an accelerated pace, with electronic equipment such as radios. If the new ones sell well, lots of used ones are available and the price of the used ones is lower.

Right now, the market price of a used IC-706 is depressed based on the *expectation* that the G model will sell well. That expectation may prove to be true or not, we don't know because we don't know what the selling price for the G model will be, nor do we

know how well it will work. But since I have no reason to sell my IC-706 right now, because it is meeting my current operating needs, I don't care what the used market price of one is doing. I'm not a commodities trader trying to make a buck on a margin account. I'm just a radio operator who owns a radio that does what I want reasonably well. When it stops doing what I want, then I'll look at what's available on the market at that point and purchase the radio that best meets my needs, knowing full well that if I wait longer, a better and cheaper radio may come along.

>
> Dave

These sorts of comparisons can be misleading. Lets assume that
we have a radio which uses a nominal 9.6 volt NiCad pack. That's
8 cells. When the pack is 90% discharged, the pack voltage will
have dropped to 8 volts and the radio will shut off. Assuming 850
ma-hours capacity for typical AA NiCads, that's 765 ma-hours
delivered.

Now an equivalent alkaline pack has 6 cells, giving a fully charged
terminal voltage of 9.24 volts, but the voltage drops rather linearly
as the charge is consumed. When it reaches 8 volts, the battery
will only have delivered 13.4% of its rated amp-hour capacity.
So an AA pack with 2850 ma-hour capacity will have only delivered
382 ma-hours before the radio shuts off.

Now the radio may be designed to work with various voltage batteries,
and the shutoff voltage may be lower, but you don't get near 90%
capacity from an alkaline until the terminal voltage declines to about
10% of the initial value, and that's almost certain to cause operating
problems with the radio.

It is also true that total available capacity is less at high discharge
rates for alkaline batteries than for NiCad batteries. That's because
the internal impedance of the NiCad is lower. So you need to figure
available capacity based on discharge rate (which is fairly high
when transmitting) as well as on available terminal voltage. When
you do that, the capacity advantage of the alkaline cells begins

to disappear.

Well, lets check the obvious. Do you have the squelch set to carrier squelch?
It won't open if CTCSS or DCS squelch is active. Have you tried changing the
carrier squelch setting? It may be too high. Is the mode setting WBFM or
auto? It may be set to NBFM or AM which won't work. Etc.

I live in an apartment building with TV sets using switch-mode power supplies. The result is horrendous cariers at about 6 Khz spacing all along the HF bands.

Can the MFJ1026 and MFJ1025 help with this problem ? Can they really eliminate the carriers which make QSO'ing impossible ? We are talking about carriers of S8-9 and I expect to hear stations of S2-5 on the same frequency.

If you have used these products then please tell me about your experiences with them. Like I don't want to shelve out 170 US$ if it ain't gonna help !!!

It seems to be individual store policy. The store where I got mine said
word from the regional office was to give them away with a purchase. I
made a large purchase the day before they came out and the manager said
to come back the next day with the receipt and they would give me one.
I did and I got a one foot long receipt for the catalog for a total
price of $0.00!

PMFJI, I live about one block from high tension high power lines. These lines generate noise from S2 to S7 depending on the weather, lower noise levels after it rains. My 8 foot grounding rod did not produce any noticeable reduction in the noise.

Would any of the MFJ or other reducers be useful to me?

Thanks

How odd, side by side comparisons by others who have posted to this group for the most part seem to be getting just the opposite of the results you get. The difference in design between the MFJ and JPS units would most likely mean a redesign of the noise antenna. Is it possible that some minor changes in the noise antenna could have resulted in much better performance for you?

Admittedly it takes some time to optimize the performance, and reduce the fiddle factor, of the MFJ-1026. However, the results obtained for a given noise with a given noise antenna seem to be repeatable. In other words you could develop a chart allowing you to set the filter before returning to a band thus reducing the amount of tuning required.

I believe both units to be good investments, and obviously some have had better results with one unit over another. Bottom line, I hope the discussion has shown the originator of the question that these type of units work well!

Message-ID: <6sbof4$de9$1@news.megsinet.net>
Source record: 133424

My experience with a severe power line noise location and the MFJ-1026 showed a two to three S-Unit reduction in the noise by inserting the filter. However, power line noise seems to have a multiplicity of phases, making noise reduction by phase inversion difficult.

I spent about an hour playing with different noise antenna setups, and was able to reduce an S7 to S9 noise level to S2 to S3. Signals unreadable with the filter switched out were copyable with the filter in-line, although all the noise was not eliminated. Try borrowing a unit from someone for a day or two to try out before you buy one.

Gary wrote an excellent explanation of the way signals are sent
using Morse. I learned much.

But the explanation is moot.

He was responding to whether the CW prosign 73 should be translated
to Seven Three or Seventy Three when used during voice comms.

The question is moot.

CW prosigns are not pronounced in voice modes because they are not
used. The phrase "Best regards" or an equivalent friendly parting
comment is sent via CW as "73."

You don't pronounce it at all; you say the words. Do you end your
conversations with the spoken phrase Ess Kay? Me neither. Far as I
know, only the New York City fire department pronounces "Kay" at the
end of their transmissions, for reasons few of us are willing to
determine.

Here are some ways I pronounce 73 when I'm using voice
communications:

"So long!" "See ya later" "Talk to you again" "Nice chatting with
you"

Hi,
have to agree with all the previous postings, this weekend used
the MAHA to charge 5 different styles of battery packs, will also
work from the car for mobile charging. If you have cups for any of
your batt. packs they can be connected to the MAHA.

If you need only a drop-in rapid charger for a particular radio type,
the Maha MH-101-series has worked well for me. For example, for the
FT-50 style of battery packs, the MH-101-Y3 works well and is usually
about $50.

According to MFJ's 1998 catalog, the sale hype states (quote) '...wipe out all types of noise ...severe power line noise from arcing transformers and insulators...'

So I guess it can do what you want, but I have yet to get my hands on such a unit to see if it solves my problem.

Thanks also to all who have made input to this thread and provided answers to my questions.

2941. QST Radio Reviews - Have You Noticed?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-30 00:00:00 UTC
From: wd1v@amsat.org
Message-ID: <wd1v-3008981633470001@bnh-2-42.mv.com>
Source record: 133446

Have you noticed that radio reviews in QST almost always
have QST going to the manufacturer to get one that passes
their tests to meet the manufacturer's specifications?

One could imagine that its because its a new model. But
they typically review after 100s have been sold. Is it
safe to conclude that most radios don't meet spec?

Test labs conducted at hamfests or at dealers sure seem like
a great thing to add to our hobby.

Who knows, maybe 20 meters ISN'T dead! :-)

Yes they can be mixed in any combination. You must remove the power
cable from the 2m and put it on the module in the middle position. Other
than that mix away...

Like my IC-Q7A covers 30-1300Mhz, probably.

Just having the dial exhibit the frequency does not ensure useful
reception across the range.

But I am a fan of the Q7A. But, best look at the sensitivity specs to
really know what is happening (and have an appropriate antenna
connected).

Phil

An excellent observation. Do you think its 'cuz QST/ARRL wouldn't dare bite the hand that feeds them?

This month's QST reviews the TenKit qrp rig. No mention of drift, and yet every one I have worked has had a drift problem. Low power is no excuse for poor engineering.

Source record: 133456

OK - An observation...

QST is in a bind. They know that the rigs are released to the public long before the rigs have been evaluated by buyers. They are also pressured by the manufacturers to get a review out ASAP. It's marketing in a shrinking market.
Hard facts of life - Advertising $'s and volume play a large part in which rigs they review.

But all of the reviews I've seen have been accurate. The ARRL is honerable in their reviews.

I think that there is an underlying motive which is to keep interest up in HAM Radio.
Long gone are the days when we could build our own rigs. [Granted - Look in any dated issue of QST and you'll find plans for a receiver or xmitter]

But the times are changing.

What to do?

1st. - Reaffirm that Ham Radio allows experimentation.
2d. Change the friggin' rules to put much more emphasis on building rigs with discrete parts rather than buying the latest ready-made stuff from Japan.
3d. Totally drop the CW requirement and include questions about the state of the art, solid-state, programmable ROM's, programming, satellite communications etc. [Helpful hint ... HF is dead! People arguing about protecting HF by using the CW requirement haven't a clue. Take HF and shove it up your ass! NOBODY cares about HF. Read Monitoring Times and see the number of countries bailing out of HF Broadcasts. Stick a fork in it! It's done!
4th. Less emphasis on HF. The real action is in digital communications and the VHF/UHF bands. Communicating with overseas amateurs is nice but it's a hobby - not a service. The Internet does it much better and cheaper. HF is dying or dead for all 'service' applications.

Amateur Radio must lead or fail.

If the point of it is to get your license to use HF then the service is over with. [Unless someone can demonstrate a digital communications effort on 80 meters and prove it superior and profitable]

Everyone has a cell phone so the service aspect in terms of catastrophes is fading fast. Kill all of my power and I can still communicate. This is 1998 not 1967. Eisenhower is dead - admit it!

Yaesu, ICOM, Alinco, Kenwood have a shrinking base of customers in the US. They will release a lot of new stuff and rely on QST and others [buyers] to beta-test it for them.

N1XNC

Hello,

I am looking for a 2m HT. Also looking for a VHF Antenna
Tuner with SWR and PWR meters.

If you are in Canada or better yet Ottawa, Ontario and would
like to sell the above items, please contact me via email.

Thanks,

73's

James Poulin

George:

The ARRL made assumptions in their proposal that I just don't find compelling, and apparently neither did the FCC!

You might enjoy a visit to:
http://www.findmail.com/list/arspolicy_license/ for a good discussion underway, and a template for sending your own formal comments to the FCC, and http://www.geocities.com/SiliconValley/2775/licensing_seriously.html for some minteresting perspectives.

I can reduce an S7 noise from a computer sitting less than 3 feet away from my HF rig with an MFJ-1026. It took some experimenting with the noise pickup antenna, but it is the only thing that did work for me. Hope you have as good a result as I did.

No, Brian, there is not a word space between the 7 and the 3. It is sent 73
just the same as Brian is sent BRIAN and not B R I A N. Morse has both a
word space and an intercharacter space, they are different. Every character
is separated from the next character by an intercharacter space, only words
are separated by a word space. So obviously, 73 is sent as a single word.
Now how do you pronounce the *word* 73?

The prosigns represented in text as SK and AR (properly with a bar over them
but I don't know how to do that on this keyboard) are *single characters* in Morse,
thus there is neither an intercharacter space nor a word space between them,
though there are intracharacter spaces inside them.

Remember that Morse is a quintenary timing code. It has five symbols. They are the
dot, the dash, the intracharacter space, the intercharacter space, and the word space.
The three space symbols are different. The intracharacter space is one dot duration,
the intercharacter space is three dot durations, and the word space is seven dot
durations. The intracharacter space separates the individual dots and dashes of a
character from each other, otherwise you'd just have a steady tone. The intercharacter
space separates one character from another, otherwise you couldn't know where one
character stops and another begins, and the word space separates one word from
another, otherwise you wouldn't know where one word ends and another begins.

When 73 is sent, it is sent with an intercharacter space, so it is one word, or
in this case, one integer number. The way that number is pronounced in spoken
English is seventy three. Yeah, two words, but that's the way integers not on

a decade boundary and larger than 19 are spoken in English (English is an irregular language). It is not pronounced seven three. That would be two separate integer numbers rather than a single integer number.

Source record: 133489

You know, there has to be some collusion in this somewhere with the battery, battery charger, alternator, light bulb, radio, radar detector, portable TV, cell phone, etc manufacturers!!!

They stand to make a few bucks selling 36/42 volts models, don't you think?

Of course, the original post could be a clever fraud . . . On the other hand, if not, and they keep it up, you will be able to use 120V light bulbs and other "not necessarily AC" devices in your vehicle without inverters, etc!!

Regards,

Bill

The 1026 works quite well. I use it to null out noise from a farmer next door that has a screwed up electric fence. The noise is very severe, but I can null it out 100% below 20 Mhz. Above that I need to get a better noise pick-up antenna. Currently I use the built in whip only for the noise antenna. The main antenna is an inverted vee up 15 meters.

You need to input a good sample of the noise alone, without the signals you want to listen to. This is the bottom line. The noise antenna phase is adjusted by the front panel controls so it is out of phase with the main antenna. The noise is cancelled, leaving the desired signals. If your noise sample also contains the desired signal it will also be cancelled. If you are using indoor antenna's for both the main and noise sample with noise sources in other parts of the building it may not work well, since you may have trouble getting a good noise only sample.

The workmanship is good, and the phase shift circuit is clever.

If you can get a amplified directional loop for one of the antenna's, it might work using only indoor antenna's.

Good luck;

Steve

I have a Bug that I would like to sell or trade, but have no idea of price.
It's chrome and has a wide base on it. Serial number is 213677. I has a
triangular shaped fulcrum and the speed setting bar has numbers on it wiht
the weight there too. All parts are on it and it's in really good shape.
On a scale of 10 (new) it's at least an 8.

Yes, I had the opportunity to evaluate an MFJ-1026 recently.

Having owned a JPS ANC-4 for a few years I was quite keen
to do an A/B comparison in a controlled environment.

Boy, was I dissapointed in the MFJ unit.

It was more fiddely to adjust and the depth of the null was
considerable less than that of the ANC-4.

Another minus in my situation is that the MFJ is not speced
up to 60MHz like the ANC-4, and after trying it it simply didn't
work at 6MX.

On a positive, I must say I was suprised at how good the build
quality was, and the use of SMT componentry.
Maybe MFJ care oming into the 90's?

Ah, sounds like the RS I go to. It's a scary thing to actually ask them
a question. They usually have no idea what you're talking about. I've
also found that I have to take them around the store finding the items
I'm looking for, rather then them showing me where they are. But the
best one was when the salesperson asked me if I had to graduate from a
school of broadcasting to get my license. If those poor guys didn't have
that catalog, they'd have no idea what they were selling...

I seem to recall a discussion last year about these extra high capacity
NiCD cells containing foam plates, which supposedly don't perform as well
under high current drain (e.g. transmitting) as standard NiCD cells with
sintered plates. Is this still a concern, or has battery technology
improved to the point where it no longer makes a difference?

IMHO I think he means that even after the No-Code license attempt to grow ham radio we still can't get enough numbers to drown out the illegal operators on 10 meters. FWIW I'm all for No-Code. I love the new license proposal. Lets do whatever it takes to expand our numbers and clout.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150

148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder

on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Minimum Volume Setting

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760

email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Does anyone have any opinions on this radio is ADI a good company and is this a good radio. This will be my first HT and I want to know if this is a good choice it seems to have a lot of
features and full 5 watts and a good price.

Thanks, Shane.

2997. Re: Comet HT antennas

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-31 00:00:00 UTC
From: Louis Bybee <louisb@datacomm.com>
Message-ID: <35EB5ECE.82BAB615@datacomm.com>
Source record: 133273

I have been using a Comet SH-95 with a Yeasu 530. It performs very well. There is a very noticeable difference in range compared to the rubber ducky.

I also tried something that has improved the range even more, but has my wife and daughter rolling with laughter. My daughter said, "you aren't really going out looking like that are you"?

I took an Aluminum hard hat and installed a BNC bulkhead connector in the top with a cable long enough to reach my belt mounted HT. I couldn't believe the difference it made! With a headset and vox setting I can operate hands free.

The newbies transgression is their effort to rid ham radio of the CW jargon used on phone. CW jargon on phone has been used ever since phone was allowed on the ham bands. The old CW ops brought it with them and the tradition persisted. The use of CQ is an example. They have been successful on FM of getting rid of CQ by replacing it with "W7xxx listening". Now that really makes a lot of sense.......

John Wilcox wrote it has been my experience that, in order to disguise their
>longevity (or lack thereof) in the hobby, many recent licensees
>sprinkle CW terms into their phone conversations to give the
>impression they have been on so long that phone is a new experience

It seem to me, the ARRL would have the "Tech's" use no H.F., and then the
FCC would class them a "D" with no new privileges. I work emergencies and am
glad to volunteer, but for long distance work I am shut out. 10 Meters would
be a workable solution to a band that is not used much, legally at least.

Hi,

A week or so ago, there was some discussion on here about dual-band HT antennas. I didn't catch what the bottom line was. There was mention of the Comet SMA 503 being good...is this the answer I'm looking for? I'm suprised to see an antenna with 0 gain ranking high with users.

I too, have tried many different antennas with widely varying results. The Diamond RH77CA is the one I use the most, but mostly just because it says it's supposed to have some gain...not from any scientific, quantifiable results. Has anybody found the Comet to be better than this antenna?

Thanks for any input.

I live about 4/10 mile from Interstate 35E, north of Dallas, TX. The truckers have all but obliterated the bottom 50 KHz or so of the 10m CW band, which sucks for me because I'm a 100% CW operator on HF (okay, 99.9%). The entire lower 200 KHz of 10m is full of illegal CB signals from all over the USA and Latin America. We can do our part to get rid of this crap by endlessly calling "CQ" on top of 'em (and, by all means, have a QSO if someone answers!). The only way to keep these jokers off 10m is to populate it with ham signals. Think it's bad now? Wait 'til the sunspot cycle nears its peak, when even barefoot 5 Watt CB signals will be S-9 or over!

John-

I'm not familiar with your PVC antenna, but you can purchase a bracket
that allows you to mount two mobile antenna whips as a dipole. With two
75 Meter whips, the total length is around 15 feet.

That's beause most rubber ducks have negative gain. The SMA503 is
a good compromise, the SMA-3 has more gain, but is longer (there's
no free lunch).

I doubt you'll have much luck jamming them off 10m, Dean. They're
used to a lot worse conditions back on the 40 CB channels than you
can likely generate and sustain. Ch 19 is usually nearly as bad as a
Dx pileup, but that doesn't seem to deter the people operating there.
They consider that *normal*. A bit of Morse isn't likely to faze them.
Probably most of them are using amateur rigs with notch filters
anyway.

From: exsvg@hotmail.com
Message-ID: <6sf0fj$72t$1@nnrp1.dejanews.com>
Source record: 133330

It bugs me that QST doesn't emphasize it very much when they have to return a radio to the manufacturer for mods or purchase a second unit in order to meet specs. They had to do this with the IC-746 in the current issue, and for a couple other high-end units in the last year.

Is this because manufacturer quality control sucks, or are they selling crappy designs? It would be a different matter if one could test and align these radios one's self with standard equipment, or even if the local hams-R-us store had the equipment to test the units out at purchase time. This doesn't seem to be the case.

I'm sticking with my FT-101!

The 11/10 metre bands have become a cheap communication
band for South and Central America. They have had several
years of quiet to breed in. It is just now we are noticing them.
Besides most of them are fleeing the crowded 11 metre band.

Use the band or lose it.

Source record: 133338

Hi,

Any info on how to program this radio would be appreciated.

Can it be programmed from the keypad ?

It has a secret switch behind the PTT rubber button and which makes the radio display the channel frequency instead of just the number. I have managed to adjust the frequency in the display by pressing H/L (up) and PRi (down) but are not able to store any channels.

Thanks,
Tore

From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <01bdd56a$2c07cbc0$LocalHost@default>
Source record: 133342
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc

Fred, is the antenna a helically wound 1/2-wave dipole ?

If so, use my program HELICAL3.exe to design a 1/4-wave helical antenna (intended to be fed against ground) and then put a pair of them back-to-back. Feedpoint impedance at centre of the dipole will be twice that of the quarterwave when the ground loss resistance is zero. Program computes wire size, winding pitch, number of turns for given length and diameter of the pvc drain-pipe helix.

Instead of feeding the helical dipole with a balanced feeder it would be better to connect the two halves directly together and use a coupling link of a few turns over the centre and feed it via coax.

Also available is program VERTLOAD which will assist with design of a 1/4-wave helix by appropriate proportioning the lengths of the mast, loading coil, and top rod. Put mast height = zero and use a very long coil former.

Should provide interesting results when installed in an attic.

Progs download in a few seconds. Not zipped-up and ready for immediate use. What-if design procedure. Click below and amuse yourself.

Source record: 133354

Hi Greg,

I am also a 99% CW guy. Thats why all that QRM at the low end of ten meters was such an aggravation when the band finally opened!

In my mind, it would take something like a contest weekend, only *every* day, to persuade these illegal operators to move elsewhere. These guys will only move (like the rest of the ham population) during sweepstakes or CQ WW weekend. 8-)

Funny how the FCC is ready and willing to jump in with both feet for license restructuring, yet shy away from ENFORCEMENT on any band.

I'll see you on 15 meters, 21.025 and up. That is, until the CB's will do 15 meters too. Then I guess the hams themselves will need to find a band to bootleg on. 8-)

73,
Don

I have an Icom 735 that puts out about 150 watts.

does anyone know what the adjustment is to turn the
power output back to 100 watts?

thanks
duane wm8n

There is not really anything in Kissimmee. But in Orlando there is an Amateur Electronic Supply, AES, store. They are off of Route 50 which is also known as Colonial Drive. From Kissimmee allow at least 30 min. to get there.

Here is AES's web address:
http://www.aesham.com/index2.html

Enjoy your stay!

I have the following for sale/trade....

<1>
dx 390 radio shack sw reciever with
box manual ect....almost new works well and no blemishes

$75 +shipping

<2>
mfj 451keyboard keyer with keyboard,
wall adapter, manual, box, keyinput

sells for 99 in the mfj catalog, street retail?

$50 + shipping

<3>
mfj 564 iambic key paddle wired with
a stereo jack to be used with any iambic
keyer to get dits on one paddle and dahs
on the other

$30 +shipping

<4>SOLD
IC 22S

<5> SOLD
radio shack digital power meter.

<6> tentativly sold
astatic D104

<7>
d104m6 mobile amplified mike
7 volt battery cage broken, you can
get another from astatic for $2.00
no connetor for radio

$25 shipped

<8>
I also have about 2 dozen 4 wire
mike cords. These are the heavy duty
belden cables that I bought surplus cheap!
I will pass the cheap on to you

these normally go for 9.95 each

$3.00 per cable shipped

<9> sold

<10>
matched pair of mrf497's I was going to build a radio
with high output but the idea fizzled...***note these are the
high output transistors that are used in the hr2510/hr2600/htx100
high output mods****
I also have a matched pair of mrf492's that I was going
to build into a 6m amp, but am going the route of a
larger output radio.

497mp $50
492mp $50

<11> Radio Shack scanners,
pro 2035 1000 channel scanner with excellant recieve
25-512/760-1300mhz
pro 2045 200 channel scanner 29-54/108-174/216-512/806-1000mhz

make offer on either one

or I will take partial trades
I am NOT opposed to trading up or down
or buying outright

looking for....

KAM version 7 or later with software/cables

6 meter radio will consider allmode

2kw or better tuner with wire/and dual coax outputs
with meters. MFJ/DENTRON/??? lets talk

ham IV or bigger rotator

I can be dealt with, if you have trades, let me know

km5rt@ticnet.com
I LOVE THIS RADIO STUFF!! remove the read47usc227beforespamming
to reply. I hate spam, and will delete it. thanks
Pursuant to 47 USC 227, any spam, harrassment, or any type of
unsoliceted mail will be forwarded to my collection agency
for a $50 fee per message. This modest fee recovers the
time lost reading the meaningless message, the brain time
to figure if it was meaningless, the disk space used until I
had time to figure, and the time and effort that it took to kill
the OFFENDING message.
If you like CW use it! If you will not be doing CW on the ham
bands, 13 WPM is probably fast enough for the test. 20 WPM will
only get you 75 khz of space for voice for MUCH time and effort...

you weigh the effort to gain ratio...it is YOUR choice! If you
are licensed, use whatever bands you are allowed to keep US agencies
and private companies from trying to steal them.
I am presently active on. 160-10 meters ssb voice,packet,SSTV and
fm where allowed, 6mssb,6mfm,2mssb,2mfm packet,2mfm simplex,
220fm,432ssb,440fm,440fmpacket and whatever else I can find.

Source record: 133367

Not only QST. First I believe that they buy the units using a third party so that they get a normal production run. I don't know if they continue the charade after they encounter problems, I doubt it. I am in the market for a new HF rig and have been reading the reviews and searching the web for comments. A very LARGE number of buyers seem to receive rigs with various problems which requires them to be returned to the manufacturer. I don't relish the possibility of spending my $$$ and then being without a rig for a couple of months while they fix it when it doesn't perform as advertised. It seems like their QC is severly lacking. Do any of these mfgs. comply to the ISO standards in their manufacturing and QC? It's not just one brand, it seems like they all are guilty. As for QST, they are the only source of reviews that I have found that does any lab testing. Most of the reviews are of the "I liked it and I talked to South Slobovia with it" variety. Most of the web comments are of the variety of "I compared ABC rig with XYZ at the local HRO for 15 minutes and ABC was much better." I have found that it takes several hours of operating at a minimum to bring out the most in any rig. The store models have had their knobs turned and menus altered so much that there is no telling how the rig is really set up. A few of the specialized web site do offer comments of long term users but how many of us are really going to admit that we screwed up after we forked out a couple of grand? Also, most of us don't have the $$$ to where we can buy two rigs for a long term comparison. John, KO0D

3060. HELP NEEDED - TS-830S PROBLEM

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-31 00:00:00 UTC
From: pstever@istar.ca
Message-ID: <jRmG1.103$sY2.672164@NewsRead.Toronto.iSTAR.net>
Source record: 133369

Greetings to all:

I have a TS-830S which has performed well for me for many years. Today I discovered that I could only get about 20 WATTS of output when I attempted to tune the rig up. I tried all the simple things like changing the driver and even installing a new pair of 6146B's without any success.

Just wondering if there might be some one out there who knows a lot about this rig and might be able to suggest an area to check.

Thanks for reading and would appreciate direct replies <pstever@istar.ca>.

Pat - VE3PZ

Holy Cow! This is getting complex. I haven't heard the word "integer"
since 7th grade algebra. Perhaps a theory exam on the morse code is feasible
after all. I wonder if many codesters would pass.

Thanks for setting me straight - really.

Best wishes,
Brian/N0iMD

cord and 8-pin modular connector similar to RJ11), HMN1010A
In like-new condition.
$50 plus freight

3073. TRIEX H470 TOWER FOR SALE

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-31 00:00:00 UTC
From: ilonka00@hotmail.com
Message-ID: <35ec20fd.22146805@netnews.worldnet.att.net>
Source record: 133382

TriEx H470 70' tower for sale.

This is a 4 section guyed tower,
including guy wires, turnbuckles,
equalizer plates, rotor plate
(drilled for Yaesu and HAM-M)
owner's manual, etc. The tower
recently lost a guy anchor and
was pulled over by the other guywires.
It is now on the ground, telescoped to
about 20', and is ready for pickup in the
Kansas City area. It weighs around 500#.
The tower needs a new base plate, and
the bottom section legs need to be straightened
or sleeved about 3' up from the base.
Other than this the tower is in good shape
and was recently painted. If you can weld,
this tower can easily be salvaged (I don't
have welding equipment or those skills). $250,
pickup only.
73,
Dan

I had made some suggestions to ICOM at Dayton after seeing the Ft-100. Looks like some of them were done. Of course, I most likely was not the only one.

Hope they come out with an antenna like the one that matches the FT-100.

You know, I am not too much for operating on HF either. But, dead it ain't!!

And, unless I am mistaken, Amateur Radio is a hobby . . .

Your mention that a "number of countries bailing out of HF Broadcasts" is GOOD news as far as I am concerned. Especially if they will bail out of forty meters!!

And, the CW requirement shouldn't be used to "protect HF" - it should be used to protect HR - ham radio!!

Bill

Dear Sirs:
Recentlyy, I'll plan to buy a IC-77. I'm
a Newhand, So I need your help.
IC-77 is profession transeceiver,Its panel
is very simply for operate. But I find IC-77
haven't IF Shift and Notch Knob which knob i
found in all amateur transeceiver. The IF Shift
and Notch is very important for amateur operate???
Or the two knob have very deep affect for DX??
Who have IC-77? Give me some advice.
IC-77 is adapt for DX CQ???

Thank you for your help!!!!

Best regard!

3086. Re: New Radio Shack Catalog

Newsgroup: rec.radio.amateur.equipment
Date: 1998-08-31 00:00:00 UTC
From: vbreault@aol.com
Message-ID: <1998083111351600.HAA22252@ladder03.news.aol.com>
Source record: 133395

I don't believe the company charges for the catalogs in an effort to make money. I believe their policy is to control the distribution of the catalogs.

Let me explain.

I worked part-time for RS for a few years during the period when they made the transition from free catalogs to catalogs-for-a-price. Prior to that time it was not uncommon for a family to leave the store with a stack of catalogs, one for each of their kids.

I can understand taking one for the workshop and perhaps one for the bookcase but I'm pretty sure that when a family took six catalogs, most of them went into the trash before the week was out.

By charging a minimal amount for the catalogs and then refunding the money on the first purchase (they used to have money-off coupons) the catalogs were still effectively free, but we didn't see people grabbing stacks of them for later disposal.

I must get down to the RS on the corner and see what their current policy is WRT catalogs.

> Hello Robin, Dan here. I have the MFJ 1025 and I say it is fantastic. My
noise is mainly a high intesity powerline noise. The MFJ totally wipes it
out. My level of crap is, at times, s9 (on a FT1000MP meter). That is
rather stout. I have not tried it with the noise you describe, however I
would say it will likely work, since all the MFJ needs is a steady noise
source to elliminate it.

In your apartment, I would recomend you get one with the built in pre-amp
and try it with a small indoor antenna. The MFJ must be able to hear
both the desired and un-desired signal.

Good Luck

That ugly antenna that comes with the FT-50R isn't as horrible, say, as the stock VX-1R antenna...but the Comet SMA-503 is a better performer. You can use it, of course, on both your VX-1R and your FT-50.

So RS does not see it as advertisement and does not think of the sales potential when they sell the catalog?

> The monthly mailout that is targeted to customers who volunteer their names
> and addresses are significantly more effective advertising than the catalog.

> store. After that they have a policy that the exchange of name and address
> information for the mailing list was a fair price for the catalog.

If the latter is true, then why did I never receive anything from them? I once was stupid enough to give them my name and address when I spent a couple hundred of dollars that day. No free catalog, no mailing.

Besides, it's really not wise to give RS your name and address for the very simple reason that they are dumb enough to print your name on the receipt. When you pay by charge card and loose the receipt then a mean spirited finder can make some nice purchases over the phone or internet. All they need is name, credit card number and expiration date.

> Use what money to plant trees? The money that they earn from the sale of the
> catalogs? They don't make any money directly from the sale of catalogs.

Yes, the money for they get for the catalog. I think it would be a fair trade to give mother nature some trees back in exchange for sales.

> In
> fact the costs of the catalog are a lot greater than the profits made from
> selling them even if everyone produced were purchased.

That's an often used argument, which is not true of course. If the catalogs would not help the sales, then I'm sure RS would not be investing in them. If they really give them away to be nice to their customers, don't you think that's because they want to see the customer return to their store?

> If you are concerned
> for our environment then take your old NiCd batteries to them to be

I tried that, they refused to take them.

Jayson, Your statments are Right on the MONEY,and REMEMBER ITS ALL ABOUT THE MONEY. The very first IC-706-MKII's had the UT-16 DSP coded in the firmware,as you stated the connectors are on board and MOST of all I do not belive the BUNK about the "delays", how can a company like ICOM screw up a simple NON "IF" DSP design, My God they can produce a NEW and Improvised model in that time frame. Or is it as you stated a way for ICOM to get more MONEY out of the Average Joe.

I just wonder how the next crop of SUCKERS will get SCREWED by ICOM when the "New and Improvised IC-706-MKII-G comes out (Soon,Soon "To keep that "Y" Company from getting any more of them SUCKERS), Can you just think what the IC- 706-MKII-H or I or J will bring, Gee may be they will start putting them out Every Quarter this way (Big KAHUNA) BoB the (MBA) can make his quota of selling MEW and only NEW Models. thanks for the reply ed,

one question for you...have you ever had a radio in for repair? do you expect that when you go to pick it up its the same model you brought in? i do. and if not i expect a timely resolution of the problem. ive waited over 6 months and called rob many times asking for this to be resolved and now im getting impatient. wouldnt you ed? before you go off on some public service message about how rob is helping the community please listen to the facts of the matter. business is based on good will and i feel rob is not acting to resolve this matter. i dont care who made this mistake, rob or uniden. i only want my radio returned. its that simple.

ps, i dont have any problem receiving a refurb unit, as long as its the same model i sent in.

Also, when the tornadoes went through southern
Minnesota this past May - guess what happened to
the cell phone towers? They came crashing down. So
guess what? The fire department had no backups, the
police had no backups. So who do you think supplied
the emergency communications? Hams. Cell phones ain't
all they are cracked up to be.

Although there are many QST bashers out there,
but there isn't anybody else doing it. The reviews
that CQ do aren't worth the powder to blow them to
hell. QST will bash a rig too. The new Yeasu rig
didn't exactly receive glowing reviews on the HF
end of the rig. The FT-920 didn't exactly receive
glowing reviews on the transmitter either.

Does anyone have the wiring diagram to hook up a Baypac TNC to a VX-1R?
Is there an easy way using the ADMS cable that I already have?

Thanks and 73

Message-ID: <35EC9748.1ACD05A4@technologist.com>
Source record: 133163

I'm looking for an all-mode 6 meter rig; I'd like one that covered more vhf-uhf bands,
but the key thing is all-mode capability and 6 meters, and these are the only two models
I've found advertised on the internet that seem to have these two features.

the kenwood ts-60s and the yaesu FT-690R

I'd appreciate hearing about owners opinions of these two rigs. If you send the comments
directly to me via email (nzc@mediaone.net) I'll summarize and post a digest of the responses to this list.

Ever since the FMers took over VHF they seem to want to change things. In the original days of 2 meter FM the 10 code was used extensively but came into ill repute after repeaters arrived. Things come and go. Self appointed language cops make the rules and ridicule those who differ. How do you call CQ on a repeater these days?

>>What about when people say "N8VCL for ID"?? Of COURSE it's for ID!

>
> Thanks

I write the faq which you can find at: http://www.blarg.net/~tdragon/faqs/
I've been busy, so I haven't had a chance to update it lately, but it won't
work with the newer FT-50s (don't know the serial number cut off of the no more
software freeband mod), and the ADMS software will make the FT-50 throw a fit about
dealing with uploads that use the FreeBand mod. (don't know the cut off of the ADMS
software either)
However, no one has told me if setting to Canadian mode still works to at
least recieve cell.

Gary,

I haven't had any problems with mine. Without looking at the manula, I believe that Kenwood's reference to "split channel" refers to odd offsets, such as a MARS/CAP repeater frequency, or a 2m or 440 rptr with an offset other than the standard.

Hope this helps!!

Allen

They started this a few years ago. The original idea was to charge 3 bucks
for the catalog, then include a 3 dollar coupon with the catalog towards a
purchase.

I went in one day and spent like 300 bucks on a scanner and some other stuff,
and asked for a catalog. They refused to give me one for free!! I couldn't
believe it! I tried to reason with the guy but he said that they were
considered store inventory and had to charge for them.

I use mine mostly to crossband through my mobile rig, so the low power is no drawback. I had to use it alone for a few days after I got my new car and hadn't yet installed a mobile rig in it, and it worked surprisingly well when operated off vehicle power via the cigarette lighter adapter. That lets it put out a full watt. It is obviously no mobile rig, but it got into repeaters better than I would have thought it could.

The only real negatives with this radio are the lack of a TT pad, and the very small amount of speaker audio it produces. Unless you're in a quiet location, you'll have to either hold it to your ear or use an earphone with it. Fidelity is Ok, just not a lot of volume, but then what do you expect with a speaker that small?

On the plus side, the very small size means you do tend to carry it with you at all times, and the battery life is very good. IMD resistance is pretty good, considering its DC to daylight front end. On the factory rubber duck, I rarely have any problems. With a better antenna, the IMD is worse, of course. But putting a gain antenna on this tiny radio sort of defeats the purpose. With a SMA-3 on it, it is no longer a convenient shirt pocket radio. The radio also fits nicely in an aftermarket ballistic nylon Motorola Startac cellular phone belt case, which is the way I usually carry it. That case has enough room to tuck in a 4 AA alkaline battery holder, which can be used to power the radio. It'll also make a watt that way if you need higher power while walking around.

Hey Brian.
Actually, one of the most sticky sticklers to this was a guy who said
"88's" to his wife every day...I dunno.

Something to remember is that spoken language constantly evolves.
Take "bad" for example...."das right, we bad."

There are less slang examples too...like "Tolerance" look it up in an
old dictionary and it defines it as endurance. Look it up in a newer
dictionary and it'll tell ya the mamby pamby "there's no absolute
truth" version.

I'd buy mine again in a heartbeat. The overriding feature is the small size and the fact that it is more likely to be with you when you need it. It doesn't matter WHAT your other HT will do if it's at home! :-)

To help on the low power situation, I keep a half wave whip in the car when I might need to get into a more distant repeater [skywarn, etc].

I bought a $10 Antenna and I asked for a catalogue, no charge. I believe
it is up to the discretion of the individual.

3131. FS: Yaesu FT-8100R Dual Bander

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-01 00:00:00 UTC
From: kf6dbh <jcssow@jps.net>
Message-ID: <35EC270F.56954F1E@jps.net>
Source record: 133223

FT-8100R like new in box, plus ADMS Software and cable $450 shipped.

Extremely nice dual bander with TRUE dual band RX, even while TXing on the
other band! Still 3 months left on the warranty.

It features AM receive, extended VHF receive, extended UHF receive, plus

750-1300 MHz coverage (cellular and cordless phone frequencies are
blocked), 110 full function memory channels (55 memory channels per band),
CTCSS tone encode, optional CTCSS tone decode, full crossband duplex, dual
receive, dual in-band receive (VHF or UHF on both receivers), direct DC
voltage display, built-in antenna duplexer (one antenna jack), DTMF
autodialer, dedicated 1200 and 9600 baud packet radio connection on rear

panel, selectable RF power output control, multiple scanning modes, and
more. The radio is manufactured to meet MIL-standard 810 rating, and can

be programmed with the included ADMS-2 Windows software. The radio is
supplied with a backlit DTMF microphone with up and down frequency controls, a
mobile mounting bracket with hardware, and a fused DC power cord.

>the FCC. Terms such as "73" or QSL have no place in phone operations. 10-4?
>So there...

Part 97.113(a)(4) does not limit the prohibition against codes and ciphers to phone operation. Use of codes and ciphers with the intent of obscuring meaning is always prohibited in amateur radio (except for a specific exemption for space telecommand functions, 97.211(b)), no matter what emission type you use. You are equally prohibited from using codes or ciphers with On-Off Keying, so what's this Morse *Code* thing you guys are using?

The escape clause is the "with intent to obscure meaning" phrase in 97.113.
We can use codes or ciphers as long as the intent is not to obscure meaning.
The FCC says that to qualify for that, the code or cipher used, and the details of the method of mechanizing it, must be publicly available in such a form that anyone can decode or decrypt the messages being sent. That's generally taken to mean that the code words, their meanings, and the details of their mechanization must be published in the open literature available to anyone.

The Q codes, the Phillips cut codes, ARRL numbered radiogram codes, and even the old Western Union codes (of which 73 is one) can all be found in the open literature, so they can be used in amateur radio, regardless of the emission type used to convey them. However, any code which is kept secret, and only distributed to a limited group, is prohibited. That means, for example, that a secret access code to a repeater phone patch is illegal under 97.113(a)(4).

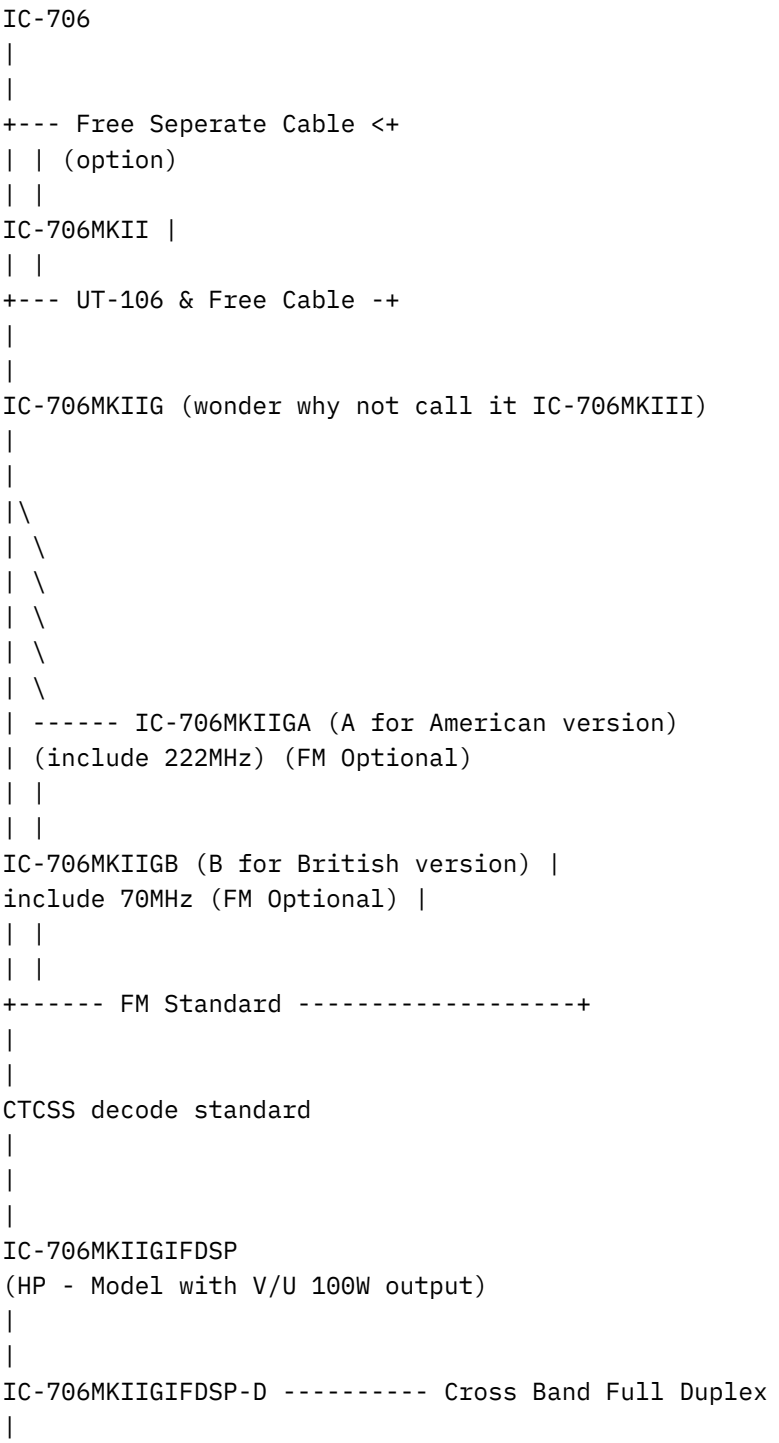
Here might be the very first unofficial IC-706 evolution path
displayed on the internet:



IC-706
+--- Free Seperate Cable <+
(option)
IC-706MKII
+--- UT-106 & Free Cable -+
IC-706MKIIG (wonder why not call it IC-706MKIII)
IC-706MKIIGA (A for American version)
(include 222MHz) (FM Optional)
IC-706MKIIGB (B for British version)
include 70MHz (FM Optional)
+------ FM Standard ------------------+
CTCSS decode standard
IC-706MKIIGIFDSP
(HP - Model with V/U 100W output)
IC-706MKIIGIFDSP-D ---------- Cross Band Full Duplex

```
|
|
IC-706MKIIGIFDSPD-MP ------- Dual Receive
|
+---> Optional 2nd Receiver
|
|
IC-706MKIIGIFDSPDMP-MINI
(Pocket version of the new generation)
(They finally give up the original case)
|
|
IC-706MKIIGIFDSPDMP-HT
(Needless to say, the HT version)
(With all the HTmarketing strategy)
|
|
IC-706MKIIGIFDSPDMP-PCR-1000
(Married the IC-706 with the computer)
(software optional)
(Free computer during promotion?)
|
|
?
```

I doubt if it really happens this way. It's just a joke.

Best 73!

troll (troll@loop.com) wrote:

> Does anyone have any opinions on this radio is ADI a good company
> and is this a good radio.

Great radio, great price...ADI usually has some sort of discount
on this gem. The operating controls aren't particularly intuitive,
so one usually has to read the instruction book...it'll keep you
fascinated for a weekend getting familiar with it...lots of bells
and whistles.

The cloning software still needs some work, but it's still better
than entering operating parameters manually from the radio's con-
trols.

Would I buy it again? Definitely.

ADI's representative, ADI/PRYME Radio Products aka PREMIER Communications
is very responsive and reachable via 'phone or e-mail.

Source record: 133231

The rise in sunspot numbers for Cycle 23 is occurring now!

From the Midwest Trans-equatorial propagation is a daily occurrence,
with South Pacific appearing around 9pm to 12am local time. In addition,
Southern Europe and Africa occasionally in the early AM.

The Naval Ocean Systems Center predictions for cycle 23 predict the year
2001 to be the peak year with an average sunspot number less than 80.

The duration of cycle 23, with average annual sunspot numbers exceeding
50, will be 7 years.

Practically speaking, this simply means that you will have the
opportunity for band openings over more years, however, wave propagation
during operating
hours, will shift more rapidly than previous cycles.

I have been retired for the last two years (with a lot of time on my
hands) and have developed a 2 element Delta Loop Driven Array Antenna
with a F/B Ratio 4.5dB greater than a conventional quad antenna.

You can view a photo of the antenna, performance charts and graphs and a
further overview of current 10-meter activity on my web page.

Thank you, 73

I *HATE* that expression! What a SEVERE lid-ism! Even the CBers don't use that dopey phrase (oh, wait, that's because they don't *have* to identify... sorry).

A bunch of us relatively old-timers (at least compared to the flood of newbies since the VE program was heaped upon us) launched sort of an unofficial campaign on our local repeater to get people to stop saying "for ID" when they identified. We gently ridiculed those who said it and pointed out that it was silly (why else would one give one's call sign, other than to ID?). Know what? It worked! You VERY seldom hear that expression on our 2m machine any more! And when the newbies get on 2m and start getting their feet wet, they don't pick up the expression because they don't ever hear it.

We also bash the ex-CBers when they use CB lingo ("What's yer 20?", "10-4", and so forth). That worked too; you don't hear CB lingo on the machine much any more.

FWIW...

Don't forget the fast scan rate of 26 channels per second and the intermod protection built into the IF, unlike any other dual bander on the market in this price range. Also, the blocked cell frequencies can be opened up with manipulation of the software which you furnish. But you must have a defective one if it only has 55 memories per band. Mine and all the others I've seen have 104 memories per band or 208 total. The FT 8000 has 55 per band. If you really have a FT8000 instead of a FT8100, then the cell is unblocked by removal of a resistor.

Great radio, great price...ADI usually has some sort of discount
on this gem. The operating controls aren't particularly intuitive,
so one usually has to read the instruction book...it'll keep you
fascinated for a weekend getting familiar with it...lots of bells
and whistles.
The cloning software still needs some work, but it's still better
than entering operating parameters manually from the radio's con-
trols.
Would I buy it again? Definitely.
ADI's representative, ADI/PRYME Radio Products aka PREMIER Communications
is very responsive and reachable via 'phone or e-mail.

FT-8100R like new in box, plus ADMS Software and cable $450 shipped.
Extremely nice dual bander with TRUE dual band RX, even while TXing on
the
other band! Still 3 months left on the warranty.
It features AM receive, extended VHF receive, extended UHF receive, plus
750-1300 MHz coverage (cellular and cordless phone frequencies are
blocked), 110 full function memory channels (55 memory channels per
band),
CTCSS tone encode, optional CTCSS tone decode, full crossband duplex,
dual
receive, dual in-band receive (VHF or UHF on both receivers), direct DC
voltage display, built-in antenna duplexer (one antenna jack), DTMF
autodialer, dedicated 1200 and 9600 baud packet radio connection on rear
panel, selectable RF power output control, multiple scanning modes, and
more. The radio is manufactured to meet MIL-standard 810 rating, and can
be programmed with the included ADMS-2 Windows software. The radio is
supplied with a backlit DTMF microphone with up and down frequency
controls, a
mobile mounting bracket with hardware, and a fused DC power cord.

original
>MKIIs?
Because they didn't have the DSP working yet. Time to market is critical
in a competitive technological marketplace. Icom needed to get the radio
out there on the market, so features which weren't ready weren't included
in the product which shipped. Later, when the DSP accessory was ready,

they did offer it as an upgrade. That's something I thought you said you
wanted,
the ability to upgrade a radio. Well they did that by including the
interface
for the DSP in the radio.
>Hasty way to make some bucks ASAP, and then introduce the DSP for free,
>like it was supposed to be with the unit all along?

It was, but it didn't make the product introduction deadline.

From: jkirkham@eng.miami.edu
Subject: New Radio Shack Catalog
They started this a few years ago. The original idea was to charge 3 bucks
for the catalog, then include a 3 dollar coupon with the catalog towards a
purchase.
I went in one day and spent like 300 bucks on a scanner and some other
stuff,
and asked for a catalog. They refused to give me one for free!! I couldn't
believe it! I tried to reason with the guy but he said that they were
considered store inventory and had to charge for them.

You know, I am not too much for operating on HF either. But, dead it
ain't!!
And, unless I am mistaken, Amateur Radio is a hobby . . .
Your mention that a "number of countries bailing out of HF Broadcasts" is
GOOD
news as far as I am concerned. Especially if they will bail out of forty
meters!!
And, the CW requirement shouldn't be used to "protect HF" - it should be
used
to protect HR - ham radio!!
Bill

I had made some suggestions to ICOM at Dayton after seeing
the Ft-100. Looks like some of them were done. Of course, I
most likely was not the only one.
Hope they come out with an antenna like the one that matches
the FT-100.

Date: (null)
From: (null)
The Naval Ocean Systems Center predictions for cycle 23 predict the year
2001 to be the peak year with an average sunspot number less than 80.
The duration of cycle 23, with average annual sunspot numbers exceeding
50, will be 7 years.
Practically speaking, this simply means that you will have the

opportunity for band openings over more years, however, wave propagation during operating
hours, will shift more rapidly than previous cycles.
I have been retired for the last two years (with a lot of time on my hands) and have developed a 2 element Delta Loop Driven Array Antenna with a F/B Ratio 4.5dB greater than a conventional quad antenna.
You can view a photo of the antenna, performance charts and graphs and a further overview of current 10-meter activity on my web page.
Thank you, 73

Hi All!

I'm considering buying either the IC-Q7A or the Yaesu VX-1R.

General opinion seems to be that the IC-Q7A is best. However, in my country the Yaesu is actually cheaper than the Icom - does this make it a better buy, or is the Icom still superior?

One other thing I've noticed - recently there seem to be an awful lot of people selling brand new IC-Q7A's. This worries me a little bit - is it a warning sign?

I know you can adjust the phase of a signal between two antennas with
a coaxial delay line. Does anyone know of a circuit that can be used
to adjust the phase of a signal between two antennas by turning a
knob?

I can't believe you guys.

You actually complain when a revised, supposedly better, new radio is brought to market?

I knew hams are a conservative bunch of (mostly) guys, but I always though that the hunger for bells and whistles, bands and features was stronger than that. I guess I was wrong.

Luru,
OH2NUP

3154. ****For Sale Icom IC-Q7A dual band Micro HT. $175

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-01 00:00:00 UTC
From: chia@news.utk.edu
Message-ID: <6shk89rvt1@gaia.ns.utk.edu>
Source record: 133246

I have a 2 month old Icom IC-Q7A dual band HT that I would like
to sell. It is a GREAT rig for extended RX. RX is from 30MHz-1300MHz!
And unlike the VX-1R which is all but deaf in many areas, the IC-Q7A is
a GREAT reciever as well as it can TX on 2 meters and 70 cm. I have had
both the VX-1R and this Q7A and the Icom wins hands down. It can store ANY
freq. ANYWHERE you want to put it in the 200 channels! The RX is great on
the AIR bands as well as 800MHz-1.2GHz! Yes, it can hear good on 6 meters
with a good antenna. The stock ducky is ok, but a good external antenna
allowed me to listen to fire/police on 150MHz area, and police on 460MHz
also to 6 meter FM activity. Yes it can pick up 222MHz band as well as the
200-500MHz bands that most recievers don't. It is a GREAT rig. Runs on 2
AA batteries for over a week (with no TX being done)! I love this rig, but
I have too many now, and my wife says to sell some. It is two months old
I have all the paper work box manual and EVERYTHING even the warranty card
so YOU can mail it in! Anyone interested in a trade or buying can E-Mail me
at one of the bellow addresses. Or if you want more info feel free to
E-Mail and ask. Thanks... BTW" I am asking $175 shipped to you via. UPS.
If you want to do another method then just let me know.

One way is to feed the signal from one antenna into a goniometer
and also to a 90 degree phase shift (e.g., 1/4 wave of coax) and
then into the orthogonal goniometer input. The goniometer
output coil can then be rotated to pick up varying relative amounts
of the two fields. You may find some benefit to putting an amplifier
between the antenna and the goniometer, to insure the load on the
line from the antenna doesn't change as you rotate the knob...

Haven't personally done this, it's just been suggested here before
some time ago. (You could use a second goniometer to adjust
relative amplitudes.)

I don't have the rulebook in front of me, Gary, but I agree and disagree
with you at the same time.

You are correct concerning obscure codes and cyphers, however, there was a
sentence referring to the preferred usage of "plain Engish" for phone
operations. Granted, this may be mentioned from an old, out of date FCC
rulebook, but the point used to be stressed in amateur radio license
training literature.

In the spirit of Amateur Radio, I'll take your word for it Marty and look
at his comment in a positive way also. I'm just slowly getting back into
amateur radio after a two year absence. With the exception of 40m,
I think they should open up all the bands to all amateurs. After all
isn't amateur radio about experimenting, and the big reason we use
to fight for keeping our frequency allocations...emergency communications?
The present and proposed class system denies the Junior class operators
the chance to experiment within all of the allocated bands, so when the
situation arrives, only the Senior class operators will be familiar with
the operating characteristics of each band thus putting more pressure
on them to carry the load of the operation during emergencies.
Opening up all bands will allow the Junior operator to get more usage
out of their equipment which get's more expensive each year. I think
opening up the voice portion of the HF bands to those without knowledge
of code, but take the appropriate written portion of each class would
suffice, and if also you want code operating privileges in these bands,
then take the code portion of the test at the present speed requirement.

My $.02 worth

Eric

I have discovered my Eco charger routinely indicates the batteries are fully charged after about an hour when I know for a fact they are dead. They seem to always want to undercharge my cells on the rare occaision they do run a full cycle.

Hi!

SO when I get thsi straight, there is NO SENSE in using 2 equivalent antennas side-by-side as MFJ suggest would be the most ideal solution to use the MFJ???

It sound logic to me that, if you put the disired signal as well into the 'noise antenna', that this would be eliminatied as well.

But what does MFJ mean then with this 'ideal' situation??? And do i have to connect an antenna to 'every source of noise', let's say an antenna for my neigbours TV, one for the powerlines 2 blocks away... If you get my drift.

What's the truth here. Do they REALLY work, or must I take so much effort to solve several problems.. Or??? IS it ment to be for one very aggresive noise only, as these stories suggest?? SO that it cannot be used as an 'universal QRM killer' but one to kill a specific annoying QRM?

Any suggestion is very welcomed

Thanks!

Kees van Engelen (The Netherlands)

I think it might be more a matter of quality control because they usually
find one that works. But for QST to be the only game in town that can
check a radio to verify it meets specifications seems ridiculous. While
some amount of built-in diagnostics would be great for future designs,
having VE test stations around the country where we could get our gear
"tested" would make more sense than testing hams! :-)

Can't agree with you fellows more heheh.....I don't know what's getting more foolish, folks using Morse expressions and Q signals on voice or just plain NOT using good / accepted voice procedure - Striving to promote at the very least ICAO STANDARD PHONETIC's and BASIC CALL and REPLY to the ops around here and discouraging the rest to drop their 11meter sounding silliness. Nothing wrong with tried and true (bugs already worked out) radio procedure whether it be on Morse, Packet or Voice - You'd think with all the general coverage HF/VHF/UHF gear around now that the ops would be emulating the real radio operators that are left (Nope - NOT the police!!!).

In case no one has noticed, amateur radio operators are required to not use codes and cyphers for phone communications. Plain language is proscribed by the FCC. Terms such as "73" or QSL have no place in phone operations. 10-4? So there...

Dropped by the local Shack today to pick up the latest flyer and
noticed the new 1999 catalog. The owner said he had to charge for them
because he was charged for them. I didn't get one. On the way back to
the car I thought "You probably have to pay rent for the store so why
don't you set up a turnstile and charge everyone a quarter to enter ?"

Oh well, there are probably other local stores who WON'T charge for
the catalog.

> As a second HT, what do you like and dislike about this radio?
> Is is worth the money even as a "toy?" How is the range, are you
> able to get into close repeaters well?

I am enjoying mine immensely.

But I am spoiled...I live in repeater-rich Southern California. I hit several repeaters regularly with my VX-1R. And I already had the ADMS-1 programming software...although the unit isn't too difficult to program manually!

The stock antenna was not too good of a performer...I replaced it with a Comet SMA-503 and occasionally the linger (about 19") piano wire flexible (from Pryme or Anli). A tremendous difference!

You will be pleased with the battery life...a 3.6V Lithium-Ion cell. You would usually purchase a second battery as a spare and use it while the other one's charging...but because Yaesu doesn't (apparently) want us fooling with the sensitive/critical charging circuitry of the Lithium-Ion cell, we do not have a readily-available method to charge the spare when using the unit. Expect some hobbyist to come up with a solution, though, soon. Charge time is about two hours for the cell.

You will not be pleased with the belt clip Yaesu included with the unit. It simply does not make you feel secure...but Bob Dashoff has a replacement that you will appreciate. Here's a post of mine from last month:

==========
Bob Dashoff, KN6GA, knows and loves his Yaesu VX-1R mini HT. And this respect for Yaesu's unit shows throughout his VX-1R Belt Clip Replacement kit!

Yaesu's stock belt clip for the VX-1R is not one of the best clips made. It just does not feel "secure" enough.

Bob saw that minor shortcoming, and went to work. What he has done is modified a Motorola belt clip to fit our VX-1Rs PERFECTLY.

A picture of one is at...

http://www.icongrp.com/~sllewd/beltclp.htm

Or email Bob and he'll email you a picture or two.

I got mine last Friday. At first, I thought I was going to be disappointed when I saw that it was a permanently-mounted configuration. I mean, there I was with a less-than-24-hour-old new HT that was super tiny, and here I go adding to its "bulk." <g> I also thought it might make my leather case worthless - by not fitting properly after installation.

I was wrong on both counts! The case fits fine, and the clip itself looks and feels great. It is a great product that EVERY VX-1R owner should have.

- Clint Bradford, KE6LCS

VX-1R BELT CLIP
To order, please send $12.50 + $1.50 shipping/handling ($1.50 covers any quantity!) to:

Robert Dashoff
28731 Lemon St.
Highland CA 92346

Email for more information: dash@dreamsoft.com

Telephone inquiries (Pacific time): (909) 862-0357

==========

The VX-1R is, indeed, an amazing unit. If you live in a region with your favorite repeaters in fairly close range, you will be pleased with its performance.

- Clint Bradford, KE6LCS

That is true. Your signal receiving antenna is picking up signals and
some local noise. Your noise antenna is picking up a lot more local noise
than signals. When the noise is equal in magnitude and opposite in sign,
thus cancelling the noise, there will be some signal left over to be
received.

> What's the truth here. Do they REALLY work, or must I take so much effort to

It works on LOCAL noise only. It cannot separate far-field noise from signals.
However, if one's signal antenna is horizontal and one's noise antenna is
vertical, it can work well on vertically polarized noise, the most common
local QRM.

Yes, the adjustment is R268. Remove the bottom cover of the
radio and it will be in the right rear corner of the main circuit
board. There are two pots close together in this location. R267
sets minimum power and R268 sets maximum power (with
the front panel power control set to minimum and maximum
respectively). R268 is the one closest to the corner of the
board.

I have two of them. The first one I bought has the MH39 control microphone
and the second one has the FS10 "Mr Potato Head" microphone. Both radios
work well, and I have come to appreciate the FS10 controller (it intimidated
me at first, which is why I bought the other type first, but now that I've gotten
over the learning curve, I like it). Both radios are remote mounted in their
respective vehicles, and the displays are mounted for convenient heads-up
viewing. It is a lot easier to control the FS10 with one hand than it is the MH39.
It is an intimidating handful at first, but you do get used to it. Especially at the
current price, and if you need remote mounting, I recomend this radio.

I'll make no excuses for the nay-sayers. They are in all walks of life, cultures, social
structures, etc, etc, etc. But, then, so are hams. Do the work - get the license, and then
get on the air and wear'em down.

You'll find more positive folks than nay-sayers. You'll find folks from more walks of
life as a ham than any other hobby in the world. Just remember, it is a hobby. Some
of these idiats will try to convince you that it is the end of amateur radio. Maybe it is
as they know it. The influx of new hams may be scaring them to death. They might
actually have to learn something new, so they'll know what you are talking about.

You can't play the game from the sidelines. Whether you get the code & the
ticket or wait until the rules change, ham radio and all of it's positives will be around
for a long enjoyable time.

Welcome aboard -- I hope to work you on HF soon.

Tony -- KF3BX

I have recently added a Heath SA-2060A antenna tuner to my small shack. I will be running full legal power through it in the near future. Anyone have mods, matintenance and/or operating tips? Any serious concerns about this as a genuine full power tuner?
(It will be primarily tuning into a 160m drooping dipole with doglegs on 160-10m, feedline is commercial 450 flatline, the real heavy duty version (#12 or 14).

> are many different trading web pages, but I'm looking to see what people
think
> is the best. Thanks..
> David Mennerich - N2TEB

David: You have set up two different parameters, biggest and best, they are not necessarily the same. There is also a difference between those one searches for buys and those on which one posts for sale items. I have found much of what I want by posting Want's on many large and small sites. I have found some of the most reasonable prices on the small to medium size sites:

http://www.kacweb.com/swaps/radio/
http://www.unique.communitech.net/swap/index.html
http://www.avarc.av.org/buysell.html
http://www.hamrad.com/~john/hamtrade.htm
http://quality-enterprises.com/tcrg/OnlineFest/
http://199.190.91.5/trading/hamradio.htm
http://www.hamtrader.com/
http://www.king.igs.net/~va3wm/
http://www.vhamfest.com/class.html
(I think this is the only site that has a fee to post.)

When selling I tend to post first to what I believe are the most active sites:

rec.radio.swap
http://www.bro.net/barc/forsale.html
http://www.fishnet.net/~ko6oy/swapage4.htm
http://www.qth.com/cgi-shl/classfd.exe/m|q|QTH.COM

Hope this is helpful.

A guy in Japan advised me that the 2 metre band there is overrun by truck drivers using amateur FM gear. If we aren't careful world-wide that band will also be lost. I note a lot of FM activity on 29 MHz from Asia which doesn't sound like amateurs.

It's OK. I have worked a few of them. Thought it sounds kinda of mushy above 35 wpm when in QSK mode. Like it's chopping some of the dashes or something. Don't know how well it RX's. Can only tell you what it sounds like over the air since I don't have one.

I can say, the faster you send, the better your signal must sound due to static and QRM. It's takes too much effort to guess what your trying to say... Best CW still comes from older rigs with a manual PTCW switch.

3204. SATELLITE SOFTWARE - HOW IT CAN HELP YOU!

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-02 00:00:00 UTC
From: emanuel.marques@NOSPAMmail.telepac.pt
Message-ID: <35ed2d06.6523483@news.telepac.pt>
Source record: 133112
Cross-posted to: rec.video.satellite.misc,rec.radio.amateur.space,rec.radio.amateur.misc,rec.radio.amateur.equipment

Many people don't know that the right software program can be of great help, even for the non professional dish installer (DIY). Others are reluctant to use satellite software because they think it's too complicated to use or even useless.

This is not a FAQ about satellite software, but an attempt on my part to try to better inform potential users about the benefices of using satellite software.

I. WHAT IS SATELLITE SOFTWARE?

II. ABOUT SKYSOFT SOFTWARE.

III. IS IT USEFUL FOR ME?
A) I AM A PROFESSIONAL DISH INSTALLER.
B) I AM NOT A PROFESSIONAL.

IV. SKYSOFT SOFTWARE AND OTHERS

I. WHAT IS SATELLITE SOFTWARE?

There are several types of "satellite television software". Some are dedicated to help professionals and DIY dish installers to setup satellite systems. Others are meant to emulate viewing cards used by encrypted channels. Another more recent type of software is meant to replace the original software of some satellite receivers in order to add new features.

II. ABOUT SKYSOFT SOFTWARE.
Skysoft is the name of my project dedicated to satellite software tools. I am only interested and dedicated to developing engineering software (dish aiming , downlink budget, etc.).
Currently I have three software programs available; EASYSAT, PCSAT, and ARQSAT.

You can find more information about Skysoft and the software at:
http://www.sat-net.com/skysoft/

III. IS IT USEFUL FOR ME?
A) I AM A PROFESSIONAL DISH INSTALLER.
The true professional plans receptions systems. It is hard to imagine someone doing all the required calculations one by one. Nor is it acceptable to use the trial an error method or go by the word of mouth to determine minimum dish size, for example.
A good software program can save you time and money!

B) I AM NOT A PROFESSIONAL.
If you are planning to buy a satellite system EASYSAT (just 25 USD!) can be a great help:
- Find what satellites you will be able to aim to.
- Find what satellites/channels you will be able to receive.
- Find the optimum dish size for your location and for the channels you want to receive.
- Help you better understand how satellite television reception works, and how individual components and parameters affect system performance.

If you already have a satellite dish system:
- Help you diagnose reception problems (satellite signal is too weak, dish is to small, deficient dish aiming, etc.)
- Help you decide on equipment upgrades (how much bigger the dish should be, will a lower noise Lnb "do it", etc.)
- Help you better understand how satellite television reception works, and how individual components and parameters affect system performance.

IV. SKYSOFT SOFTWARE AND OTHER SOFTWARE PROGRAMS.
There are other software programs that perform similar tasks, in what ways are EASYSAT and PCSAT different?

Being a long time user of satellite software myself, I have found that available satellite software falls into two categories:

1) Programs with many functions, but unfriendly and too technical for most users.

2) Programs easy to use, but with few features, "over simplified", and easily outdated. These are usually free programs sponsored by satellite equipment manufacturers and therefor are designed to work with only a particular brand of equipment (dishes).

Having practical knowledge of satellite systems design and installation. I have been integrating really useful functions and features to my software programs. Some of them are exclusive of my software, which makes them arguably the most user friendly and useful software for the typical professional and DIY installer.

For more details, please go to the Skysoft Web Site at http://www.sat-net.com/skysoft/

Hi folks :) I'm an electronic musician *seriously* looking for the following musical equipment, in any condition, even broken:

-OLD SYNTHESIZERS from the 60's-80's Moog, ARP, Oberheim, etc

-OLD KEYBOARDS w/ knobs or sliders Roland, Korg, Sequential, etc

-OLD DRUM MACHINES w/ terribly electronic sounds :)

-OLD SEQUENCERs w/ knobs for each step

-OLD VOCODERs for that "robot-voice" sound

-MODULAR PATCHABLE SYNTHESIZER GEAR, complete systems or individual modules - "Switched on Bach Moog", ARP 2600, Paia, anything similar.

-RACK SYNTHS, INTERESTING EFFECTS and anything related to the above.

-Moog, ARP, Korg, Roland, Sequential Circuits, Oberheim, Yamaha, EML, Electrocomp, EMS, Synthi, Putney (VCS3), RSF, Buchla, Serge, Polyfusion, Ionic, Paia, SMS, Wavemaker, E-mu, Steiner-Parker, Chroma, Aries, etc.

-Roland TB-303 Bassline

-Roland TR-909 Drum Machine

-Roland TR-808 Drum Machine
-Roland TR-606 Drumatix

-Simmons SDS-7 + SDS-5 + SDS-6 Drum Brains and Sequencer

-Pearl SY-1 Syncussion

-E-mu SP-1200 Sampler Drum Machine

-Sequential Prophet VS rack
-Oberheim Xpander
-ARP 2600
-Korg MS-20/50

If you have any of the above OR SIMILAR for sale or know someone who might, please email me at rolandman1@aol.com

and include phone number as well if you'd like.

Thanks in advance and apologies if this post annoys anyone.

Source record: 133122

Thanks for reading this posting...I just bought a new FT-10R hand-held & I am have trouble in receiving anything outside of the ham band. In the specs, Yaesu claims that the rig will receive from 140Mhz to 174Mhz yet after getting home & reading the instruction book that comes with the rig it states 144-148 Mhz. coverage. I have tried to reset the upper & lower settings to expand the coverage by attemping to reset the lower to 140Mhz & the upper to 174Mhz. but NO LUCK. I have called the dealer but they can't help me...these rigs are very hard to program. I should have gotten the program & cables to do the programing on the computer & then down loaded it to the radio. Does anyone have a FT-10R which they have gotten it to cover these portions of the band. I wanted to use this rig to listen to the WX Freqs. & also have 2 meters for communications when
we go camping or hiking. My wife & two daughters are also hams.
Thanks for any & all info!!

I agree with Gary's comments. I also have two of them. I replaced the Kenwood TM-741A with the FT-8500. The FT-8500 is certainly NOT an easy radio to program, not like the TM-741A, however, it is a much nicer radio in styling and performance. On one of the radio, I purchased the "Mr. Potatoe Head" mic and that made the programming a lot easier. Radio is ideal for remote mounting in the car. On one of FT-8500, I purchased it used, the lithium battery was weak so I called up Yaesu and took it down there. I waited about 15 minutes and the rig was done. No charge. Yaesu's service is unsurpassed. I have noticed and experienced the same with my other rigs like the VX-1R and FT-1000D. Good luck in your purchasing decision.

Has anyone had troulbe progemming their V7A. I just bought one ane the owners manual makes little of no sense to me. I do not understand the difference between repeater offset and what Kenwood call Split channel. I know what a repeater offset is. What I don;t iunderstadn is why do I have to enter the TX frequency when I have the auto offset function set to on? Csan anybody help or am I missing someting in the manual?

I am a very novice enthusiast and want to find a copy of a manual for my
Codar CR 70A MK II which has been sitting collecting dust.
I suspect it not amongst the greats but it would satisfy my needs if only I
can get to understand how to use it correctly.
If anyone can suggest, or point me in the direction, of a source to
buy/borrow a copy of the user manual that would be great.

Thanks

Nigel_Andrews@msn.com

Vince, I used "The Simplest Phasing," article that Roy was talking about. It does work. It is not like pointing a beam and hearing big signals come back from some far away place. What happens is you hear signals you have not heard before from that part of the world that you did not hear on your dipole. Some times they were strong, but most times you were able to copy at some acceptable level without getting frustrated. It allows one to hear in a direction with out adding a bunch of gain, by excluding other directions.
I wanted to work Japan. So I set up my two verticals 66' apart, broadside toward Japan, and fed them just like the article said. Each morning I could sit at the radio, about 6:00 to7:00 AM local time, I live in Idaho, and work JA's, CW every morning, when I could not hear them before, only on occasion. There signals were not strong. I could hear them and work them, until one of my guy's was caught in a garden tractor and bent one of my verticals in half.

Source record: 133139
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

The C510a is a superb dual band HT with wide band RX. The CPB510a is a 50w power booster with extra filtering for enhanced in-band intermod rejection. When used together, the power booster provides power to the HT along with external connections for an antenna and speaker. The power booster also has a cable that connects easily to the HT. It's basically like a mobile rig with a full function mic!

I acquired the rig at the last Dayton Hamvention. The HT (with case) is in perfect condition and the power booster has never been powered up or even unpacked (I just haven't had the time to get to it).

Asking price for all three pieces is $595 (I paid over $750 last May).

Please feel free to contact me at bfranki@frontiernet.net.

Why do we have:

rec.ham-radio.swap
rec.radio.amateur.swap
rec.radio.swap
alt.ham-radio.marketplace

???

They all have the same stuff. Is there Anyway anybody can combine them all? What ends up happening is everybody posts to all of them, then when you're looking for something you end up reading all of the groups, and see mostly repeats.

The "communication age" gets ugly.

I'll put in another good word for it. It has been (in the ~3 years I've had it) a good solid radio. Never any "intermod" problems in dual band operation, only slight problems in dual VHF operation. The FS-10 is "geeky" and has a learning curve, definitely, but seems to do the job it was designed for. The most annoying thing I can think of is the DTMF autodial -- it's too much trouble to get it in and out of autodial mode, so I just leave autodial off. How about this, Yaesu: use the ENT key to force autodial, so if the user presses PTT, presses ENT, then presses a number key, that autodial memory is activated. Or something like that...

Hi,

I have trouble extending the frequency range of my Rexon RL-155 2-meter HT. It looks a bit like the Yaesu FT-11, only bigger, so I tried to hold down UP and DOWN while powering the radio. It worked fine once, but not anymore ! I pressed the keys another time, believing that this sequence toggled extended rx range off and on. The radio now has only 144 - 146 Mhz both rx and tx.

Any help would be greatly appreciated.

Tore

Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I've heard that AEA has gone out of business. Great! Now that I've found a deal on a PK232 and also a PK88. (So much for waiting!)

Now my question, should I buy either one or both? Is there any support for either one? How about if I want to get into APRS? How about NET/ROM?

I'm familiar with packet and TNCs in general, having had a KPC-2 @ 2400 baud and a PacComm TNC2 @ 9600 baud in the past. (5 yrs. ago...)

Any pointers concerning these two units?

BTW $99 for the PK232 and $35 for the PK88

Thanks for the info, I just need a circut to use around 146.5 mHz with a transmitter. I don't need to know what the phase is, only that I can dial it between +/- 180 degrees without having to shut off the transmitter and that it maintains a 50 ohm load to the source.

Thanks 73 de KB7ADL

> So there...

Yes, plain language (but not necessarily plain English) must be used
in international communications:

S 97.117 International communications.
Transmissions to a different country, where permitted, shall be
made in plain language and shall be limited to messages of a
technical nature relating to tests, and, to remarks of a personal
character for which, by reason of their unimportance, recourse to
the public telecommunications service is not justified.

There is no plain language requirement for domestic communications
but there is this section:

S 97.113 Prohibited transmissions.
(4) Music using a phone emission except as specifically provided
elsewhere in this Section; communications intended to facilitate a
criminal act; messages in codes or ciphers intended to obscure the
meaning thereof, except as otherwise provided herein; obscene or
indecent words or language; or false or deceptive messages, signals
or identification;

I don't see how QSL or 73 can be considered as intended to obscure
the meaning of a message (or intended to facilitate a criminal act).

If you feel that they have no place in phone operations, then don't
use them. But that is your choice; it's not a requirement of the FCC
unless you try to sing them :-)

Great! Congratulations! GLAD to have you join us on HF and I hope I see you on 40 (or 80 or 15) CW! You WON'T find the good-ole-boy club on CW. We LOVE newbies! Just remember the magic words, "PSE QRS" A few months of on-the-air practice and you'll be doing 13 wpm easily.

Also, if it's hard to find folks in the "Novice/Tech Plus ghetto" on 40 meters, try the Fists CW Club.

http://www.fists.org

They have a "Code Buddy" program where newbies are matched with old timers for on-the-air scheduled QSO's.

We've "inherited" a Telrex BIG BERTHA tower which creaks while rotating.

Was the tower supposed to run dry or were the bearing surfaces supposed to be oiled/greased? I note on our blueprints the 1/2" drain pipe which runs to base of the tube. Was this to drain or oil the tower?

Does anyone have any additional info / materials regarding these beasts?

Thanks

Dean, one question. You don't hear it anymore because:

a. they changed their behavior.
b. they went somewhere else.
c. you chased them out of the service.

Brian/N0iMD

You aren't shut out, pass the tests and you can use all of the spectrum.

3256. Recommendations for Good QRP SSB/CW HF Rig?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-02 00:00:00 UTC
From: dstok@tiac.net
Message-ID: <6si4qt$aqj@news-central.tiac.net>
Source record: 133181

Does anyone have any recommendations for a good rig for QRP, which has SSB and CW, only for HF bands?

I'm looking for something that can funciton like an "appliance" in a worst-case situation, but has enough features that let someone who knows what he's doing optimize reception.

Any recommendations? Thanks.

I don't think that anyone thinks they make money of the catalog itself, but they do put these catalogs on the market as advertisement. They even advertise in the flyer to pick one up at your local RS store. I just wish that instead of putting coupons for products I don't want in their flyer (finally got one today..) they'd put a coupon for a catalog..... This would serve RS in two ways. First they'd control the distribution (people need to clip the coupon and actually go to the store, so some intrest in the products must already exist) and secondly, it brings their target group (people who already have proven their buying potential, the names in their database) in the store.

3260. Re: Ever wonder why it was not called "73s Magazine"??

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-02 00:00:00 UTC
From: jspin@evansville.net
Message-ID: <35ec9280.93203009@news.alt.net>
Source record: 133185

On Mon, 31 Aug 1998 22:53:52 GMT, Everybody was talking about:

You know how all of us set goals in life to work towards?
Mine is phone privileges on 40 meters, I've listened to the
old wise hams on 40 meters and thought about the wealth of
knowledge that resides with these people. Yeah really! I thought
that if I worked hard, studied, took the time to learn CW and
practiced very chance I got that I'd eventually reach my goal.

Last weekend I went to the local club and passed element 2 and
3A of the examination....yeah that's right if I'm approved by the FCC
I'll be a NO-CODE TECH (Ah the shame of it!) My next plan was to
attack CW so I could in a few months go back and pass the code
test then over the winter work on my Advance license. (can't get away
from the stigma of that no-code tech too soon!)

Well now I'm starting to have my doubts about the character of the
people that I thought I wanted to QSO with. In the past few weeks
I've listened to numerous Qso's about the license restructuring and
was amazed at some of the comments, I won't go into details but
I'm sure most of you folks can imagine what was being said, granted
I did hear some (very little) positive comments about bringing new
blood into the bands to keep them alive, but most were very negative
and in some cases down right hatefull!

Anyway I'm starting to wonder if I set the correct goal for myself? or
even if ham radio is what I thought it was. It would seem to a
observer that ham radio (40 meter phone) is a exclusive club that
doesn't really want any new members. Maybe I'm wrong but it seems
from some of the comments I read in this group that I'm closer to the
truth than I care to be!

Having never been involved in AM but knowing people who are
I've been asked several times why I'd want to spend my time studying
CW? Their analogy is a comparison of CW and riding a horse before
one could get a drivers license.....a point that's hard for me to
defend. All I can tell them is that to reach my goal it's one of the
hurdles I have to jump.

Whatever the final license scheme turns out to be I'll carry on
towards my goal, but when I get there I'm not sure I'll find anybody
who will make me feel like it was worth the effort!

73 to all!

jspin@evansville.net (soon to be a NO-CODE TECH!) sigh.....

Dave,

The Manufacturers are open to suggestion.
When Icom first came out with the original 706, there were alot of postings in this newsgroup with suggestions for improvement. Icom must have read them, (and I think they do), and took some of the suggestions, and incorporated them in the MK II.
I suggested a thermostat for the fan (many others also suggested this), and I like to think that they used my suggestion.

I don't know if you can E-mail them with a suggestion, but they certainly seem to listen to people.

Why not suggest what you would like to see in a radio? Who knows, that could be in the next version.

I would like to see 70cm in the IC 746, and I really think that is on the way. I also would like to see trunk-tracking ability in some of the wide band recieve radios. Would this have to be licensed from Uniden?

As far as the 746, I an going to buy one next year, when they add 70cm, and also DC-daylight recieve, trunk tracking, and include software for computer control and memory location writting. :) Too much to ask?

73, W9FL Tom

Message-ID: <35ECB181.719FE6F5@teleport.com>
Source record: 133188
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

This is nearly impossible to do in a predictable way, unless the antennas are very lossy. Here's why: As you change the relative phase of the currents in the elements, the mutual coupling between the elements changes. This changes the feedpoint impedances. When the feedpoint impedance of an element changes, both the phase shift and voltage or current transformation through any kind of network or delay line changes. The result is that the final currents in the elements will generally be unequal in amplitude, and not having the relative phase you'd think. There's more information about this in Chapter 8 of the _ARRL Antenna Book_. You might also take a look at "The Simplest Phased Array Feed System -- That Works" in the _ARRL Antenna Compendium_, Vol. 2.

This is not to say you can't make a system where the phase can be varied with a knob. It's just that unless the elements are lossy, the current ratio will change along with the phase, and the phase won't be what you'd predict based on constant-impedance loads.

If the elements are very lossy, the impedance change caused by mutual coupling is swamped by the loss. The elements can then be adjusted to match the feed system, and their impedance won't significantly change as the phase is varied. This is a viable approach for an HF receiving array, but not for transmitting due to the low efficiency.

One other exception I'll mention in passing. If there's a very large number of elements, each element is in essentially the same environment, so the impedances of all except the outer ones will change together by nearly the same amount. This permits conceptually simple phasing systems for very large arrays. Huge arrays like this are used primarily for radar, and not for typical amateur applications.

I am considering buying an Icom IC-706 or 706mkII. Since my favorite mode is CW I would like to hear comments from anyone on how well this rig performs on cw. How is Icom's optional CW filters in this rig? Good S/N ratio ? I need something more portable to drag back and forth from my cabin and since I am currently lugging seperate rigs for HF, 6 and 2 meters the 706 would better fit my bill. Any comments at all would be welcome please.

Tim-

I cannot give you a fair reveiew on CW, as I do very little CW work. The IC-706 is an excellent rig though for all-around work. The MKII model has anumber of enhancements over the original model, and the current incentives from Icom make it almost a no-brainer as to which model to choose.

Portable, the 706 is very compact, rugged and a good performer on SSB and FM. The menu system does take some getting used to, but it grows on you. I have used mine now for several years, and have just bough tthe matching AT-180 for it. The separation kit is almost a must for mobile use if you are going to actually mount it. I use a Timewave DSP-9+ on SSB and don't miss the filters at all.

I would choose the IC-706 over and over again, but I have to admit I would have waited for the MkII if I had known it was coming.

Go buy one. You'll be hard pressed to find so many features in a small box like this.

It's ok. I have used one at a field day that had a cw filter. It was pretty tight. But I wasn't overly impressed with the overall audio quality of the rig. Seems to maybe have a tad to much rf gain on the low bands. But I imagine this is due to catering to the mobile ops. It wasn't distorted or anything just kinda flat sounding. But heck, what can you expect from such a small radio, and also I'm spoiled on my 830 and other rigs. Good sensitivity on the high bands. Overall I'd say it's ok. Reliable with a decent track record. And small. I use a old IC 730 in my car, and has been a very reliable radio over the years. MK

MY GOD!!! I paid $50 for a 386 with more resources than that, and I got to test it out first. The last time I saw a laptop like that at that price was sometime in 1990. Drop it down to at least $75, if not $50, and you may acually sell it.

I have learned that the catalog price will be changed to $0.00 in the point of sale system at RadioShack. I would imagine this would happen as soon as the programmers can download the new price into the store's computers.

So all your complaining was heard by the powers that be at RadioShack.

Now, can you find something else to whine about?

From: Peter Shintani <shintani@funtv.com>
Message-ID: <35EF6CEB.B54A5CF8@funtv.com>
Source record: 132968

Hi:
What is a good second hand dual band rig ?
I previousl owned a FT-530 and also used a Th-79A. I liked the FT-530
more. What is the going market rate for both handies ?
On a different note, I heard that only the earlier Ft-530's and
also perhaps the TH-79A's could be opened up for cellular frequencies.
If so, what serial numbers indicate the cellular capable vintages ?
Peter

Yaesu FT-2400 45 Watt 2M Mobile

Radio Hard Reset
CPU RX/TX re-program Instructions

This will be nescessary after completing the out of band modification and
from then on if one of the following happens:

1) Loss of power to the CPU occurs. This will happen if the internal
lithium battery is dead and or has been replaced.

2) May also be nescessary after a sudden power drop, ie. starting your
vehicle while it's battery is very run down.

3) An accidental Hard Reset occurs.

Hard Reset - Push D/MR and Rev/Skip while turning power on.
Display will read: 28.00

Program RX range - Tune Display to read: 138.00
Push D/MR

Tune Display to read: 174.00
Push D/MR
Display will read: 28.0

Program TX range - Tune Display to read: 138.00
Push D/MR

Tune Display to read: 174.00
Push D/MR

*Please note after hard reset default repeater offset is 000.
You must change offset back to desired number, ie. 600.
Of course all programed memories are lost.

From: Richard Carroll <w0ex@scan.missouri.org>
Message-ID: <35EF61AB.D087C2B@scan.missouri.org>
Source record: 132973

The parts list shows it at Q10, a 40468A, but the schematic shows it as
Q10 an FX-80 and Q11 as the 40468A which is a MOSFET that shares a
small PC board with the IC. The parts list shows no Q11. Evidently an
oversight on the part of the tech writer/proof reader. I'm convinced that the
correct designation is FX-80. I have no idea what modern IC that would
crossreference to. Good luck,

Dick W0EX

Hi John,
I have a good old SB220 that works fine and has full output on all bands, however it has previously had the Richard Measures q60 meter mod dont and that band is not functioning right. All the other, original bands work perfectly. It looks good but does have a couple of marks on the front panel edge where it got chipped while being inserted/removed from the cabinet. With the original manual. I got it in a big trade and do not need it as I'm keeping the Dentron ML2500 that I have had for years.(it already has 160 mtrs) I'd be interested in a trade if you might be. You can call me at 417-469-3347 if you want to talk about it.

The only sure cure is to move your antenna far enough away from the
telephone wiring system to prevent induced RF from affecting the phone(s).

When I moved my antennas from the house roof to the lot behind, about
100 feet away, my intractible RFI problems disappeared.

Well I've got an Icom IC-706MKII in my '86 Chevy S-10 pickup.
It's mounted in the space below the AMFM/cassette player.
Don't run mobile CW with it as I only use it for SSB & sometimes FM.

It also makes a great SWL reciever

Antenna is a Bugcatcher. Don't use any kind of antenna tuner.

the alt group

>They all have the same stuff. Is there Anyway anybody can combine them
>all? What ends up happening is everybody posts to all of them, then
>when you're looking for something you end up reading all of the groups,
>and see mostly repeats.

As noted above, the first two groups are bogus groups and only appear
on servers which do not honor the official group creation process. In other
words, they have very sporadic and limited distribution, don't use them.

Rec.radio.swap is an official big eight group and should appear on every
server. That is where you want to post for sale ads. The distribution of
alt groups is also somewhat sporadic, but at least it doesn't violate
the usenet group creation process.

A good newsreader program will suppress the display of crossposted
articles. After you read the article in one group, it is marked read in all
groups. This can greatly speed perusal of groups prone to crossposting.
But you can improve things even more by unsubscribing to the bogus
groups.

This is a nice unit indeed.. Make my Wavetek this model 5100 wave synthesizer is stable and frequency selectable anywhere from .001hz to 1Mhz!! Just dial up the frequency you want and youre there ON THE DOT!!! No estimations on this one!! Attenuation controls and input also for sync signals (should you need one) This unit is EXCELLENT for either benchwork, or for generating audio signals for calibration, testing, or anything else!!! Dont let this one go by!! Lucky winner pays shipping FOB Miami, Florida.. Happy Bidding!!

See it and BID at:

3318. 1941 Wireless: Range

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-03 00:00:00 UTC
From: Hugh MacDonald <uisdean@fox.nstn.ca>
Message-ID: <35EE12FF.C5D9720B@fox.nstn.ca>
Source record: 133037

I am a graduate student studying the early years of World War II. In connection with this work, I have come across specs for a wireless station as follows:

Wireless apparatus: powered by one 50 kilowatt diesel Astor triphase unit producing 2200 volts, alternating current, reduced to 220 and 120 volts in 50 cycles. Unit is also supported by twin diesel Astor motor units supporting direct current for some of the apparatus.

The apparatus can be operated:

- As a marine radio, on 600, 620, 640, 660, 680, 850 and 900 meters, with a power of 500 to 2,000 watts.

- As a radio broadcasting station, on 492 meters with a power of 250 watts.

- For international radio communication on 16800, 11200, 8400 and 5600 kilocycles with a power of 500 watts.

Can anyone tell me, assuming that this apparatus was on the coastline ... how far out to sea would the unit be able to communicate ... as a marine radio and as a broadcasting station?

Any observations would be appreciated ... this unit was in operation in 1941. What difference would it have made for international communication if the station had been able to broadcast at 11200 and 6400 kilocycles at a power of 5,000 watts?

Thanks in advance for any help.

Brian,
Timewave Technology Inc. has complete support for the PK-232, PK-88 and other former AEA products, including repair, phone and email tech support, accessories and upgrades. In fact, we just introduced a new DSP upgrade for the PK-232/PK-232MBX. For further details, check our website at http://www.timewave.com or call us at 651-222-4858. (If the new 651 area code doesn't work from your area, please try the old 612 area code - apparently some telephone company switching centers are not yet programmed to recognize the new area code!)

Thank you,
Randy Gawtry, K0CBH

Hi all,

I have a problem with a Yaesu FT-747GX shorting the power
supply as soon as it's switched on. It is intermittent,
although very repeatable, happening about 50% of the time.
When it does turn on, everything operates okay, it's just
a problem getting it to turn on!

Anyone seen this before?

Thanks,
Steve VK3ESM

From: jdc@cci.com
Message-ID: <6slv4g$9s@bmerhc5e.bnr.ca>
Source record: 133049

For sale: That hard-to-find power plug for Yaesu VX-1R radios.

Price, including first class postage to 50 states and Canada:
1 connector for $3.00
2 connectors for $5.00
3 connectors for $6.50
(add $1.50 for each additional connector)

We also have 7806 regulators for an additional $0.50 each when
you get one or more connectors.

Add wire and a couple bypass caps and you can have a 12-volt
adapter for under 5 bucks. Compare that to the $38+ that Yaesu
wants for their's. (At the Rochester hamfest it was "only" $35.00.)

Send a note saying how many you want along with a check or M.O.

3331. EZnec modeling base tank coil?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-03 00:00:00 UTC
From: "news.netins.net" <schiers@netins.net>
Message-ID: <6sm2np$8ap$1@ins8.netins.net>
Source record: 133050
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I must be thick headed.

I'm putting up a 20m half-square at my new qth. I have the tank circuit for the base feed designed: 2.7uH and 47 pf.

I would like to model both the antenna AND the matching system using EZnec. I know I can enter the value of the parallel resonant circuit as a Laplace transform, which Roy makes easy by hitting P and entering R,H,C, but what I can't figure out is how to place this parallel circuit at the base of the antenna and have it do "something" <grin>.

Wire 1 End 1 is the beginning of the feedpoint, i.e. the bottom of the first vertical. This is where the coil/cap combo goes. One side goes to the vertical, the other to ground, tap up a few turns from the bottom, and presto, 50 ohms.

Questions:

1. Can I model this with EZnec?
2. If so, how do I model the tap point?

What I would like to see is the predictes VSWR bandwidth with the coil/cap in place. Modeling the antenna without the feed is easy, putting the load at the base and being able to "tap" the load at the 50 ohm point is anothe problem altogether. Am I trying to do something that the software cannot do?

I have sent Roy a private message, but my isp has been "erratic" lately, so I'm not sure he has gotten it. The news seems to be working fine, that is why I ask it here.

Would someone accomplished with EZnec and loads please explain to me how to place this tank circuit at the base of a vertical antenna and feed this load at a particular point along the "coil" that is modelled as a parallel R,H,C for Laplace conversion in EZnec.

Thanks

>with a power of 500 to 2,000 watts.

On a clear frequency without interference, at night, 500 watts is
adequate for trans-Atlantic communications on these wavelengths. 600
meters = 500KHz, a distress frequency (then too) so it should have
been clear, barring other emergencies in progress.

>- As a radio broadcasting station, on 492 meters with a power of 250 watts.

492m=610KHz. From a strictly technical standpoint, the coverage of
this frequency should be similar to that of 600m. (reduced slightly
because of the lower power) However, interference is much more of a
problem in the broadcasting band. I wasn't around in 1941 so I don't
know exactly what the band sounded like, but my guess would be you'd
get 1500km or so.

>- For international radio communication on 16800, 11200, 8400 and 5600
>kilocycles with a power of 500 watts.

This power level is capable of world-wide communications on these
frequencies.

>1941. What difference would it have made for international communication
>if the station had been able to broadcast at 11200 and 6400 kilocycles
>at a power of 5,000 watts?

The signals would be stronger & less subject to interference.

WANTED: KENWOOD TS-830S in ****ABSOLUTELY MINT**** condition (cosmetic and function). This means new, out of the box-like condition. In other words no dents, dings, scratches, rust, corrosion or discoloration of any kind. I can't stress this enough because I've already logged several hundred miles in my home state driving to pick up *MINT* rigs which turned out to be less than desireable (to put it mildly).

Gold Labels and added filters a plus, although not absolutely necessary. Will consider all responses.

Thanks,

Richard H.

Hi Clark,

I was talking with some friends last night on 10 meters SSB, and they agreed that the QRM from Central & South American CB's is making 10 meters nearly unusable to the Hams when the band is open. I guess that there were alot of extended frequency range CB's sold while the solar cycle was at minimum. The CB'ers are using the radios like an intercom or phone (it's possible they don't have phone service) and are unaware that their echo'd AM is bothering the hams or anyone else. This is a major MAJOR problem on 10. As for 2 meters, try the Los Angeles Saddle Peak two meter repeater for an example of the undisputed fithiest and worst. For me, two meters is not an option! 73, Don WB8YQJ/6.

Really? I live in Orange County, CA. and things are fine here. Where is 2 meters "lost"? I am genuinely curious (I thought things would be worst here near Los Angeles, and since 2 meters is pretty good here overall, I wonder where it has gotten worse!)

I normally do not endorse anyone's business on
this newsgroup, but once again, I have to 'plug'
Bob's business here.

I used to by my sweep tubes from all different
places and now I buy almost exclusively from Bob
because I get consistant quality from him..

The exception being if I run into some NOS sweep
tubes at a TV or Radio shop somewhere and they
sell them all to me at $2 or $3 each!

I dunno...I can hear 'em in South America just fine, but along with
that I worked a bunch of LUs, PYs and eventually Europe and a VK
around 28.020 yesterday (Tuesday) through the other junk and it wasn't
all that difficult even using my old FT-301D rig. Sure, they're there
and maybe they shouldn't be (the US doesn't govern the world, you
know...how many other countries have a 220 band?) but if it doesn't
stop me from QSOing halfway around the world using a 20 year old rig
with the sensitivity of a brick on 10, I fail to see reason for rabid
complaining.

Hmmm. So how were you able to talk to your friends if the band
is unusable? It was open into SA yesterday, I could hear some of
these stations, but they certainly didn't make the band unusable.
A beam with a good F/B or F/S ratio puts them down in the mud,
and a touch of power buries them completely.

>I guess that there were alot of extended frequency range
>CB's sold while the solar cycle was at minimum. The CB'ers are

>on 10.

I agree that it is somewhat of a nuisance, I suppose especially so
for the QRP crowd, but it is far from making the band unusable for
amateur communications. It is nothing at all compared to the foreign
broadcast signals on 40m at night. But most of us don't write off
40m because of a little interference. We just tighten down our
filters, boost our power, and proceed on.

>As for 2 meters, try the Los Angeles Saddle Peak two meter
>repeater for an example of the undisputed fithiest and worst. For
>me, two meters is not an option! 73, Don WB8YQJ/6.

Is that the *only* channel on your 2m rig? There are plenty
of "good" repeaters in the area too, plus ample opportunities
to operate simplex. Why let the antics on 1 repeater color your
judgement of a band 4 MHz wide? That's like saying 20m is
useless because of the antics of those on 14.313 MHz.

Use twin Power Amplifiers, one for each of the antennas.

Vary the phase at the low-level input to one of the amplifiers with a
simple phase-shifting network using a twin-gang, receiving-type, variable
capacitor, and a couple of small coils.

But a complication - the two antennas will be quite closely coupled to
each other. Varying the phase of one of them will seriously upset both
antenna-transmitter impedance matches. So although you have a one-knob
control of phase, you will still have to use several other knobs to
re-adjust the amplitude.

This interaction between amplitude and phase is inevitable whatever method
is adopted. Isn't life complicated, eh?

There's that 'just think of yourself' attitude again. This applies quite nicely, IF you plan to stay home and talk only to yourself. If you intend to interact with others you have to give them some(not 'total', but 'some') consideration too.

Samlex America Inc. has recently announced the introduction of two new DC power supplies designed specifically for the telcomm industry. The models SEC 1212 and SEC 1223 are switching supplies that provide output current of 10Amps and 23 Amps at 13.6 VDC. Both models are listed by Underwriters Laboratories and comply with FCC regulations. The units are backed by Samlex with an industry leading three year warranty. More information on these high quality power supplies can be found at Samlex America's web site www.samlexamerica.com

Heathkit SB-200 linear amplifier for sale.
Covers 80-40-20-15-10 meters.
600 watts output on SSB.
500 watts output on CW.
Very nice appearance, couple of scratches only.
Needs new tubes, output is low. (a pair of 572B)
Comes with instruction manual and all cables.
Works on 110 v. but can be rewired for 220 v.

Asking $300. U.S. shipped insured to your QTH by surface mail, 35 lbs.
Inquire by email.

Source record: 133081

I don't have the 8500, but two 8000's, and am also very familiar with the 8100. I looked at the 8500, with both the regular mic and the Mr. Potato Head mic.
As far as I am concerned, the 8500 has wayyyyyyy toooooo long of a learning curve as compared to almost any other radio you can name. Yes it does do most everything, but with IMHO, with too much difficulty. Menu layering upon menu layering is not conducive to easy operating. But that's my opinion.

Another thing is that most users of the Mr. Potato Head mic say is that you almost always change some setting or other nearly everytime they handle the mic. This has been noted in numerous newsgroup (this one) posts for some time now. And the other mic forces you into the menu layering method of changing whatever because there are no knobs or controls except for the few buttons on the mic. That's why I opted for the 8000 and 8100, and I originally was going to get the 8500, but I wanted a radio that I could use and enjoy and not have to work at using or spend time at changing nearly any setting.

As far as the autodial mode goes, that I agree with wholeheatedly. It stinks. If you compare it to the mic used with my Kenwood TM-742A, all you do is load in the autodial numbers into memory, press and hold the PTT button and press the PF key followed by the digit containing the autodial number you want to call. That's it. Nothing more to it. It autodials just like that. Easy as pie. This is exactly the method that you refer to using the ENT key.

Just about the best autodial system I've seen. Yaesu, are you listennnnnning?

I have a HP LogicDart hand-held logic analyzer which I won in a drawing. New, never used, except to verify that it works, complete with original box, manuals, probes, etc. Won product of the year awards from at least three major trade magazines. Great tool if you are into processors and digital design. Sell for $625 or trade for good oscilloscope or ham radio HF Transciever.

You're not allowed to. You have to say you are "monitoring," or "listening"
Then nobody comes back to you, and the repeater gets quiet again because that
nobody wants to talk to someone they don't know.

3367. Re: EZnec modeling base tank coil?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-03 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <35EF147E.FF056329@teleport.com>
Source record: 133086
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

The method you proposed in your email message of using the EZNEC SZ (Alternate SWR Z0) parameter as a transformer, and a load at the feedpoint to cancel the reactance, is reasonable, at least for modeling the SWR curve. Although I think you could represent the tapped tank as a parallel inductor of value L/K^2 and capacitor of C*K^2 (where the tap is 1/K the way up the coil), there's no good way in EZNEC to put it or any load in parallel with the source, where it needs to be. You're probably doing about as well as you can with the SZ parameter and the load.

Andre, I've got an ADI 201. It is OK, and the high power battery seems to last a long time. The display is its weakest feature - difficult to read. Great features otherwise.

Hook up with the AKSARBEN club - very fine bunch of folks. I was a member there and BAC when I was stationed at Offutt AFB.

CrACKeD <cracked@primenet.com> writes:
>My FT-50 was plagued by the annoying problem of sucking batteries dry while in
>an "off" state, but I had it fixed. I'd like to measure what the drain is now
>(hopefully less than 1 mW?) while the unit is turned off, but how can I do so?

Take the battery pack off the back of the rig. Figure out which two
pins on the back are power and ground (the circuit diagram, which came
with the radio, shows you which order they are in, plus you can measure
voltages on the battery pack). Connect a pair of clip leads to these
two terminals. Connect other end of the leads to a bench power supply,
or a battery - anything that supplies 6-16 VDC will do. Then break the
circuit somewhere (anywhere) and insert a multimeter set to read milliamps.

If you have an external power cord for the radio, you can use that
instead of the clip leads. But you still need to take the battery pack
off, so you aren't charging it.

The radio will draw somewhere between 10 and 100 mA during receive
(the specs will give you a better number). If you have the battery
saver enabled, the current will jump up and down as the receiver is
turned on and off. With the radio turned off, the current drawn should
be well under 1 mA. The defective radios apparently draw 5-10 mA when
off.

I hate to do this but I think 6 months is long enough to give someone to complete a trade.

I swapped Kevin a new Midland UHF handheld, large battery and an Icom CM-35 charger back in April of 1998. I was supposed to get a pair of SCSI hard drives and 6-32mb simm modules.

During the ensuing deal I inquired about older CPU's, and a SCSI adapter card, which Kevin graciously threw in the deal.

I got all that I asked for except the simm modules, which he has been promising to send for 6 months, with every excuse in the world. He claimed to be out of work and had to borrow money to ship the simm modules, which I offered to pay for shipping.

I am posting this so that others who swap with Kevin may be alerted to the possibility of a bad trade. His email is bednark@garden.net. I don't have is amateur callsign handy or I would post it too.

Whoever pauses to read this may recall last month another ham made a similar posting regarding Kevin's bad trades.

3388. AN/URC-32 ??

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-03 00:00:00 UTC
From: windbrkr@erols.com
Message-ID: <MPG.1059148da5ceacab9896d3@news.erols.com>
Source record: 133107

Has anyone ever seen the AN/URC-32 shipboard transceiver available on the surplus market?

It was truly a thing of beauty in its time, a 500 W multi-mode rack-mounted, varactor-tuned HF rig, created by Collins for the U.S. Navy, and maybe other customers. Solid as a rock, and a real mechanical and electronic pleasure to work on.

I first encountered it 35 or so years ago, while in Navy electronics training at Great Lakes, IL. I would expect there would be *some* sign of it in the surplus afterlife by now, but I haven't found a trace, aside from various mentions in Collins equipment listings. Could it be they're all still out there somewhere, in service?

Any leads or comments? Thanks!

Have you removed the bell housing and replaced the gear grease. It became very diffucult for the rotor to turn after 35 years of operating when I replaced the grease 2 years ago! That might remedy the overheating of the transformer.

There is a photo of it with an antenna installed on my web page - http://homepage.interaccess.com/~jpearl/DeltaXray.html , if you care to see it.

In 35 years of operation with triband quads, delta loops and yagis the only other servicing was to replace 216-264 MFD capacitor available at a local motor rebuilding firm for a couple of dollars.

Some things just may last forever!

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.equipment

I have for sale or trade an RME DB-22A preselector. It is complete, but untested. The cabinet is in good shape, not dented and not rusted but the paint is in awful shape. Inside, it is clean and shows no serious corrosion or rust, no burnt-up parts, no obvious modifications. Now, the bad news. There are NO markings on the VFO dial! Big dummy (that's ME) disassembled the unit to clean it, and used (an unnamed brand) spray cleaner on the VFO dial, which instantly dissolved the markings! D'OH! Yeah, I felt really stupid, but the damage was done. If'n you have another dial from a parts set, this one's quite restorable (or maybe you can make your own?). BTW, the little paper Factory Test slip is still glued to the bottom cover (I managed not to mess that up!) and it was tested 3/1/49! The original interconnect cable and line cord are in good shape and still attached. I haven't tested the toobs.

Cash offers? Trades? I'm always looking for CW and novice transmitters (fixer-uppers, of course).

This is my work email address, so if you <REPLY>, I won't get it until next Tuesday. If you want to reach me before that, catch me at home:

Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Spare VHF Rig FS:

Kenwood TS-700S 2-meter All-Mode Transceiver w/internal Advanced Receiver Research (ARR-P144VDG) GaAsFET Low-Noise Receive Preamp. 12 watts output on SSB/FM/CW (3 watts AM). Has built-in 120 VAC supply or will operate from 13.8 vdc. Prospective buyer will note that all miniature-panel-lamps would need replacement to illuminate S-meter, mode, channel and analog display, but without doesn't affect usefulness; also the 144 MHz band shows 141.200.0 on the digital display, even though it works fine actually operating on 144.200.0 MHz (the operating reference frequency on 144 band only is 2 kHz high, so if motivated adjustment can be made--or use it as is). Comes with copy of Service Manual; AC and DC power cords and hand mic. $240 with internal preamp--or will sell for $195 without preamp. Hears well without preamp, but is excellent with preamp. Will split shipping cost lower 48. If interested Email "w9jj@arrl.org" or call Bart at 860-594-0251 weekdays.

3394. FS: Yaesu VX-1R power plugs

For sale: That hard-to-find power plug for Yaesu VX-1R radios.

Price, including first class postage to 50 states and Canada:
1 connector for $3.00
2 connectors for $5.00
3 connectors for $6.50
(add $1.50 for each additional connector)

We also have 7806 regulators for an additional $0.50 each when
you get one or more connectors.

Add wire and a couple bypass caps and you can have a 12-volt
adapter for under 5 bucks. Compare that to the $38+ that Yaesu
wants for their's. (At the Rochester hamfest it was "only" $35.00.)

Send a note saying how many you want along with a check or M.O.

Post a little more information to help people answer you.

Frequency, line of sight or obstructions in the way, why you have to
stay inside with the antenna (can you mount something on a balcony
railing), etc.

We have three 2m repeaters, at least one good 440 repeater, a 220 repeater in our town alone. And with 500 hams in the county no one ever gets on. Oh, some times you will have some one call another ham or use the patch. But there is no rag chewing, no fellowship.

Before you buy the SMA-501, look at the post from clintbrad4d@earthlink.new
on August 20, 1998--
He has a different opinion of the SMA-501.
As for me, I have a Comet SMA-3which is a bit flimsy for my tastes. It has
a couple of kinks in it, and it didn't take much to get them there. Not
forgiving at all, like the stock antenna.

3399. YAESU FT767GX Audio Chip???

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-04 00:00:00 UTC
From: Terry Gaff <shbcommm@indigo.ie>
Message-ID: <35F04DA2.F0A4FD55@indigo.ie>
Source record: 132920

My Yaesu FT767GX Transceiver was damaged lately by my two year old pressing buttons to the effect that the unit was left transmitting for several hours. I have been reliably informed that the AUDIO CHIP is damaged. I actually dont have access to the 767 at the moment so I'd really appreciate it if somebody could let me know what the audio chip part number for this unit. I've also been told that the IC in question is fairly commonly used in various sets.

Thanks a lot.

Terry Dublin, Ireland.

Hi:
Is there anyone out there that has some sort of
programming software for this radio.

I know that the radio is EPROM controlled and you
need the dedicated programmer from the manufacturers
but, if you remove the EPROM only instead of the
whole board I imagine that it can be programmed
with some software especially written.

Any comments or suggestions are apreciated

Clint, I would take the posting to mean that this person preferred the Q7A over the VX-1R, and acted upon the preference by disposing of the less-desired HT. What's to explain? Preferences are very often tough to explain *and* impossible to dispute.

The more pressing question is how to get to know this person that gives away VX-1R's... ;-)

Darell -

I just refreshed my group list and I don't show "rec.ham-radio.swap" or "rec.radio.amateur.swap" available in the groups on my USENET news server.

If they exist, these would be redundant and the content would belong in "rec.radio.swap."

Perhap the groups you describe are on FIDONET or CLARINET or some other resource which is simultanesouly available to you rather than the USENET newsgroups?

As I understand it, as moderated USENET newsgroups, they'd have to go through a formal process to be created. Could happen through poorly informed committee. I'd expect to find under proper circumstances that it would be difficult to justify the creation of either.

I don't see an "alt.ham-radio.marketplace" either but the alt. newsgroups rapidly come and go as anyone can create one. They sometimes are also not readily/fully transmitted throughout the Internet so may not be on my server.

This only addresses redundant newsgroups. Even bigger problem is people post forsale/trade/wanted all over instead of in the specific newsgroup in which it should be placed, "rec.radio.swap".

3424. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-04 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6snt6d$3kn@news.Hawaii.Edu>
Source record: 132987
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

The T8-A can be modified to transmit on these frequencies by the
removal of a diode. Reception on these frequencies is a mod that can
be done on the keyboard.

>
> This interaction between amplitude and phase is inevitable whatever method
> is adopted. Isn't life complicated, eh?
Thats a route I haven't seen much. Myself I just fire em up and see what
happens. I try to cut as close as possible etc, but still have varations
in the surroundings as far as metal .So instead of trying to be real
accurate I just cut em and go. I try a lot of different lines and try to
note the directivity by listening to alot of stations. I've found some
good setups by accident a few times that had alot of gain. With the
phased 5/8 gp's I had on ten , I had one line that would give me nearly
6 db over a single 5/8 almost straight north. One of these days I'm
gonna phase 2 elevated 40m 1/4 waves. And will double as 5/8's on 17m. I
think if I spaced for 5/8 at 17m that would be 1/4 wave spacing at 40m.
Should work neato as a unidirectional pattern on 40m. Or 2 dir if I
switched phase. And would have the max gain of 5/8 space on 17m for
broadside. I may do it this winter if I can work up the energy..g MK

Your problem is not with the manual. Its the terms offset and split.

The repeater offset is for most repeaters.

If you check the repeater directory you will see some do not use the
normal offset or split.

For those you use the split freq which is in effect two distinct freqs.
one for transmit and one for receive that you pick.

Clarification for the original poster:

I would point out the one caveat to this - communications would be entirely dependent on skip conditions on these frequencies. While they are "capable" of worldwide communications, at any one time these frequencies would experience signal paths to only a restricted fraction of the Earth's surface. How much surface and exactly where would depend on the day/night cycle, the season of year and the sunspot cycle. Bob, KI8AB

That was my opinion too, but after mastering that long learning curve, it actually
turns out to be quite easy to use.

>Another thing is that most users of the Mr. Potato Head mic say is that you
>almost always change some setting or other nearly everytime they handle the
>mic. This has been noted in numerous newsgroup (this one) posts for some time
>now.

And all of us who said that (I did too) hadn't noticed the *lock* button which
prevents you from accidentally changing settings. Just flick the lock button
off to change things, and back on when you're done adjusting things and no
problems. I've now dropped the mic several times, nothing has changed,
and nothing broke off (that was something else I was concerned about).

>And the other mic forces you into the menu layering method of changing
>whatever because there are no knobs or controls except for the few buttons on
>the mic.

That's true. The MH39 is a pain to use. But if you have a Yaesu FT51, you'll
feel instantly at home with it. I don't, so it took me a while to learn, but a couple
of friends of mine who have the FT51 were at home with it right away.

From: Michael Tyson <mtyson@concentric.net>
Message-ID: <6sspn7$ggr@chronicle.concentric.net>
Source record: 132768

Anyone have any experience with the TM-741A? On 2M it's rated for 5/10/50 watts, but I'm getting 3/9/19 watts. Low & Medium power are close enough, but 19 watts is like 4dB down from the rated 50. I've tried a different antenna & feedline, but SWR with both was quite low so that's not a problem. I only have the users manual that came with the radio which isn't much help. Anyone know where the power out adjust is? (I hope it's just an adjustment & not realy malfunctioning.)

Thanks,

73 de Mike, N2GEG

An attenuator is a device which reduces the signal level. 40db is a 100:1 ratio. If you were to put 100uv into it you could expect 1uv out. Weinshel makes them as well as a number of RF equipment manufacturers. Most are coaxial devices and have constant impedance. I have seen them at swapfests and they come in values from 1db to over 100db.

I have just recently purchased a W32A HT. I have been traveling a lot for business and bring it along. I have noticed an extreme weakness to front end overload and images. In hotels, if there is a strong UHF sig, for taxis,etc., I hear it all through the bands.

Great radio otherwise though, fun to play with.

Hello to all,

1st please don't respond to this e-mail as I am just visiting family for

the Labor Day weekend and they will not know what you are talking about.

(my e-mail is clairopt@earthlink.net)

I was glad to see something positive come up in this discussion. I
recently wrote a piece for QST which was published on the very topic.
Some of you would benefit reading it and having a more positive attitude

:).

If you want to change things, get on and operate the band. I have had
many enjoyable hours working DX on 10meters. Many hams are so caught up
in what takes place on a FEW kc's that they over look the whole band.
It is like the analogy of the grapes, you can over look a few bad ones
and savor the sweet ones, or throw the whole bunch out because you see
one or two bad ones. My answer to those who cant find anything good in
what they hear is to get on and make a difference. Learn to use your
radio by using the filters and notch, much of what you hear will be much
less noticeable, most of all, loose the gloom and doom attitude.

>another ham or use the patch. But there is no rag chewing, no
>fellowship.

Well, someone has to take the initiative and say something interesting.
It might as well be you. If you wait for someone else to do it, it may not
happen. I've noticed that if you develop a reputation as someone who
has interesting things to say, you don't have any trouble bringing others
out of the woodwork to join you in conversation. Conversely, if you
develop a reputation as someone who is an inane conversationalist,
you'll get few responses when you put out your call on the repeater.

So don't be boring when you talk on the repeater. Try to think up something
interesting to say every time you get on. It'll catch on, and soon you'll have
lively conversations on your repeaters.

Sorry to hear about the fence noise. Since I live next to a farmer with one I know what your up against. Mine, when he turns it up is s9 on 80 meters and drops to s3 at 15 meters. Other times, when turned down or when shorted its gone.I've never seen his unit, we are not on that great of terms, but it seems to be of a different type than others I've heard in this area which are a very quick pop noise, like ignition noise. His is 1/2 second on and 1/2 second off. It's terrible. I think he uses it to burn and kill weeds along the fence as well as keeping his six or eight animals in.

I have a MFJ 1026 unit which works on the same principle as your unit. What is critical is to a good noise sample. That is, you need an antenna pick-up with only noise pick-up with little desired signal. The other antenna is, of course your regular antenna. I use the built in MFJ antenna for the noise antenna, and it works well up to 20 meters. Above this I am going to put up an external noise antenna. The farmer has approx 5 ac fenced and one side of the fence is about 50 feet from my house. The fence, when at it's best, can be heard for 1 mile on the car AM radio. When nulled, the noise is below atmospheric noise on 80/40 and just barely noticable on 20. The tuning is fairly sharp with the MFJ unit.

These units do work, but like I say it is critical to have a good noise sample.

Haven't heard about nail polish, but the model train industry has a series of clear paints for doping bulbs. I've used it to dope the lamps in my L4-B.

3474. Yaesu VX 1R Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-05 00:00:00 UTC
From: Anonomoose <nospam@gte.net>
Message-ID: <6srj33$8kj$1@news-2.news.gte.net>
Source record: 132871

I bought a "adms-1d" software with serial cable (Version 1.04 I believe), and the instructions kept talking about a "second" cable to "adapt" the serial cable for the VX 1-R Receiver. The cable that I received was simply a db9 to "Stereo" mini plug. (IE: 3 conductors, tip-ring-sleeve.) No other cables. nothing with 4 conductors (Tip-ring-ring-sleeve) or anything.

Is this correct? Is the cable suppose to only be a 3 conductor cable? Or am I missing a crucial part?

I would appreciate if you could get back to me and let me know if I need to obtain a 3 conductor mini to 4 conductor mini or something like that?

P.S. If I have the VX 1-R receiver with Firmware version A106, will your software, or any other software open up the 800MHz frequencies?

Also, Does anyone know if you can open up the 42.00-43.00 MHz frequencies for recieve? I noticed that the unit starts higher than that, and I would like to be able to hear the 42-43 MHz freqs!

I really appreciate any help on these subjects...

Sincerely,

Steve Ross

These include rapid batteries, rapid chargers and antennas for each radio. The radios are in excellent condition and are versatile radios for all your needs. The modest price is $200 each and you pay for shipping. Shop around and you'll find my prices are the cheapest around. E-mail me to order. No bids. Thanks.

Message-ID: <6srlpddpi1@server.cntfl.com>
Source record: 132876

I'm interested in knowing the value of a used Kenwood TS-440S HF Xcvr. There is one in a local pawn shop, in good condition (8-9), but unknown if working or not. Could not find a manufacture date on the unit. Also do not know if power supply and other accoutrements are included. An educated opinion would be gratefully accepted. Thanks!

I'm certainly not expert at pricing radios, but I would think that $250 to $400 would be an appropriate range. Since you, or the pawnbroker does not know which options are included and there is no way of determing if the radio is operational. I think I would low ball him and explain that without a warranty or confirmation of operation, it is doubtful that anyone will pay market price for the unit. Just my thoughts.

Be aware that the legal deviation for FRS is about half of what we use
on the ham bands. So in addition to being illegal (TX only, of course),
you may also cause interference.

Not really, but if you need more words.....

Original question was is the Q7A any good.

I owned both radios.

I kept the Q7A: Translation is I think it is good.

I gave away the VX-7R: Translation is that I think the Q7A is better
than the VX-1R.

Beyond that, wait for the full reveiw in QST.

Message-ID: <6srsoj$n1b$1@nnrp1.dejanews.com>
Source record: 132880

I have an icom w32a HT. It's fine except for one thing. It's front end is VERY easily overloaded & de-sensed by local RF (pagers, etc.) A friend who lives near by has the same rig and has the same problem. A friend of *his* who has a Yaesu HT (sorry, i forget which model) said that he did *NOT* have this problem.

Well, first of all, I'm wondering whether this is a problem only with the w32a or with all Icom's HTs. In particular, what about the new one that includes 6 meters?

Also, I'm considering getting a 746. But I'm wondering whether this front end problem plagues Icom rigs in general??

For Sale - Larsen Model AD-2/70 Dual Band Antenna Coupler. New in package - $25 + postage. I have a few of these.

This is a dual frequency duplexer that permits simultaneous operation in both VHF and UHF. This is designed for the 2 meter and 70 centimeter bands, but is useable on commercial VHF and UHF bands.

Crossband isolation is -50dB VHF @ 430 MHz and -60dB UHF@140 MHz. Power input is 200 watts max. Size 1.77" H x 2.63" W x 3" L

This will allow two separate antennas on a dual band radio or one dualband antenna on two separate radios.

Good point. Though at least with that variety of frequencies
available, the chances of at least one being open are pretty good.

>deduct individual items on their tax form.

True. Until I bought this house, there was no point in itemizing - my
taxes were lower if I used the standard deduction.

Even if you can deduct it, note that the deduction is applied to your
total income before figuring your tax rate. Looking at my 1997
return, if I'd donated another $150 in charitible contributions, my
tax would have been reduced by $42.

Basically, unless you're right at a border between tax rates (or
you're willing to commit tax fraud!) there is no way you can get ahead
financially by donating something rather than selling it. Of course,
it may well be worthwhile to donate it for alturistic reasons!

From the Drake List Reflector:

The nail color to get is called "Peacock Blue". Unbelievably, it is apparently a more-or-less standard color since I bought mine ~3 years ago in some beauty supply store in CA and saw some as recently as yesterday in Virginia, at a chain called Sally Beauty Supply. (It's my wife and daughter that go to these places, guys, I just tag along. Got that? I-just-tag-along.) Seriously, I think I've seen this stuff at Wal-Mart, etc. Really not hard to find, I don't think. It works well, in my experience. My fear was the bulb temp would discolor the nail polish. Not so yet. Again, this little trick works best *with* the existing clear blue filter, not in place of. It is kind of an equivalent fix to removing and reorienting the blue filter, placing the bleached out spot in another, less noticeable position. FYI, I think Drake still has original clear blue filters available if anyone wants to go that route. In my case, use of this nail polish trick, seen in QST years ago, yields a rich Drake blue hue to the dial and meter, maybe ever so slightly darker than original, but very very nice looking. I've done my R-4C but not the T-4XC yet and the difference is quite noticeable. Good luck.

From the Drake List Reflector:

I had no ideas there were so many suppliers and shades of fingernail polish - about 8-10 racks. My wife helped, and she found it, but what a search, at only one drugstore (Eckerd's). # 163 Peacock Blue, made by Artmatic. The TR-4 dial filter was not badly faded, one coat on the bulb looked good - I tried 2, but was too dark. The S-meter looks to have no blue filter, so 2 coats look good there.

I have found the best method for blue lighting is to coat the bulbs with #30
Light Blue "stained glass" enamel, made by Dekka. This stuff can also be used
for making custom colored bulbs of any color for stereo receivers, etc. It is
made specifically to coat glass for light transmission, and appears to hold up
well at high temps. It is available commonly at art and craft supply stores.

3499. FT-8500 PCC/CAT

Info. required please:

Does anyone know if anyone has written a CAT / PCC program for the Yaesu FT-8500 (to use via e.g. the FIF-232 interface)?

Thanks, regards,
Dave G7WDT

I can't speak for the extended rx, but it sounds like you are missing an
adapter cable. The one that came with my ADMS-1D v1.06 is about 6 inches
long and appears to be 4 conductors on the end, which gets connected to the
cable like you have.

Didn't you get my email on this last night???

The ADMS-1 software ships with a 3-to-4 connectow adapter for programming the
FT-50 and VX-1R (the only two I'm familiar with).

If your software was purchased new, please ask your delaer to make it good.
Otherwise, contact RT Systems and ask them to sell you one.

Hi Guy. AES gets $799.95 for a used TS440S/AT...The /AT means that it has an optional automatic antenna tuner installed. There is probably no way to tell if the unit you are looking at has one. The TS-440S need a 20 amp 13.8 volt power supply to run in the house. If you don't see a fairly large external power supply, you will have to get one elsewhere if you buy this radio. Ask the pawn broker about a hand mic, and manual. The radio should at least come with these 2 items. They may be behind the counter. I would say $450. would be a fair price, if you can try the radio out. if not, I would not give more than $150 for it...no matter what kind of guarantee the pawn broker gives you. Unless he is a Ham, he is unlikely to really know if it even lights up or not. Remember the motto "let the buyer beware", and good luck.

Hellow. My name is seung-jun lee, live in south-korea

Well, I need HF rig(All band, All mode). So If you don't mind, I want to swap my two TH-79A's, KENWOOD for your rig.

They are excellent condition and used temporary.

TH-79A's spec is below.

reply for "seungjunl@lgis.lg.co.kr"

Lee.

==========

TH-79A : Dual-Band Handheld Transceiver

The TH-79A handheld transceiver offers the optimum combination of operating ease and powerful performance in a compact, lightweight design. And it's clear at first glance: this slim-line FM dual-bander (2 m/70 cm) sports a dot-matrix LCD -- the first in its class -- providing alphanumeric access to a unique guide function as well as a user-friendly menu system. Other features include 80 non-volatile memory channels with ID, DTSS and page functions, and a DTMF memory function for auto-dial operation.

Features at a glance:

2 m/70 cm dual-band operation
Compact, light design
MOS FET power module
Dot-matrix LCD, guide function & menu system for easy operation
Dual receive on same band
Alphanumeric memory & alphanumeric message pager function
80 non-volatile memory channels in EEPROM
ID memory & DTMF memory
TH-79A/E: In Detail

FET power module

Equipped with a high-efficiency FET power module, the TH-79A is extraordinarily slim and lightweight. Lower voltage requirements mean improved reliability and longer operating time per charge.

2 m/70 cm dual-band operation

Despite its compact design, the TH-79A offers extensive dual-band functions, including full-duplex operation and the ability to simultaneously receive two frequencies even on the same band (VHF+VHF or UHF+UHF). In addition, A.B.C. (automatic band change) ensures that the

transceiver will switch automatically between main and sub bands when a signal is present.

Dot-matrix LCD & menu system

Making its debut on handheld transceivers, the dot-matrix display greatly improves user-friendliness since there are no limitations on the variety of messages it can handle. In addition to frequency data, this can be used to access a menu system with full alphanumeric display of functions and settings. The operator can also scroll through a summary of current operational status.

Guide function

This transceiver can be used right out of the box. In fact, there's no need to carry the manual because of the innovative guide function -- simple operating instructions that appear in the display at the touch of a button.

80 non-volatile memory channels with ID

The TH-79A has 80 memory channels -- all capable of storing transmit and receive frequencies independently, thus allowing split-frequency operations (The TH-79A version also has 2 call channels). For greater convenience, an alphanumeric ID (max. 7 characters) can be recorded to identify each of the channels. Memory shift and memory clear functions further improve operating ease. And since all data is stored in non-volatile EEPROM, no back-up battery is needed.

Multiple scan modes

As well as full band and dual programmable band scans, there is MHz scan and memory scan. Carrier-operated and time-operated scan stop modes are also provided.

DTMF keypad with DTMF memory function

The built-in DTMF keypad enables direct frequency entry (in VFO mode) and direct recall of memory channels (in MR mode). It is also possible to store up to 10 different 15-digit (maximum) DTMF codes with ID for auto-dial and autopatch use.

DTSS (Dual-Tone Squelch System) with pager

DTSS opens the squelch to allow DTMF access to the receiver, while the pager function will alert the operator to an incoming call (this can be switched off automatically with the correct paging code).

Power-on call sign display

The TH-79A can be personalized so that the operator's own call sign (up to 7 characters) is displayed when the unit is turned on.

Other Features:

Selectable dual- and single-band operation
Tone alert system with elapsed time indicator
Channel display function
Auto repeater offset (VHF)
Input overvoltage warning
Lock functions
3-position output power control (High, Low, Economy Low)
Auto power-off and battery save function
Operation of DTSS, Pager, DTMF, and CTCSS is subject to local regulations.

Specifications:

Frequency Range
144 Mhz
Tx: 144 - 148 Mhz
RX: 144 - 148 Mhz

3525. Re: I need a circuit for phasing Antennas

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-05 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <35F0B0E8.998738AC@teleport.com>
Source record: 132944
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

JB (quoting RL):
>>This is nearly impossible to do in a predictable way, unless the
>>antennas are very lossy. Here's why: As you change the relative phase
>>of the currents in the elements, the mutual coupling between the
>>elements changes. This changes the feedpoint impedances. When the
>>feedpoint impedance of an element changes, both the phase shift and
>>voltage or current transformation through any kind of network or delay
>>line changes. The result is that the final currents in the elements
>>will generally be unequal in amplitude, and not having the relative
>>phase you'd think. There's more information about this in Chapter 8 of

JB:
>I always thought that the mutual coupling was a function of the physical
>properties of the array, and not the current. (see Kraus' ANTENNAS)

RL:
What you're probably referring to is _mutual impedance_, which is a function of only the physical properties of the array. When you place a current-carrying element (call it element 2) near another element (call it element 1), element 1 behaves just as though there were an extra voltage source placed in series with the feedpoint. The amount of this voltage is a function of both the mutual impedance and the current in element 2. The presence of this extra voltage at the feedpoint causes a change in the feedpoint impedance of element 1, called "coupled impedance" by Jasik and others. Of course, the change in element 1's impedance may cause a change in its current, which in turn modifies the current in element 2, etc. In the case of a parasitic element 2, exactly the same thing happens: coupling from element 1 induces a current in element 2, which modifies element 1, etc. I was using "mutual coupling" to refer to this process of interaction.

The equations relating element feedpoint current and voltage, and mutual impedance, can be found in any antenna text. In either the first or second edition of Kraus' _Antennas_, they're equations 11-9 and 11-10. Equations relating the feedpoint impedance to element currents and mutual impedance can be found, among other sources, in the _ARRL Antenna Book_, Chapter 8, Eqs 19 and 20.

JB:
>Unless the array is completely symmetrical the feedpoint impedance will be
>different at each element.

RL:
This is correct, but the symmetry must also include the currents. For

a two-element array, the current in element 2 relative to the current in element 1 has to equal the current in element 1 relative to that in element 2. So the only two-element arrays with physically identical elements and equal magnitude currents which have equal feedpoint impedances are those driven exactly in phase or exactly out of phase. Feedpoint impedances of the elements of the popular cardioid array (2 elements spaced and phased 90 degrees apart), for example, are quite different from each other.

JB:
>It _is_ possible to predict in theory. All you have to do ;-) is form a _big_
>matrix of all mutual couplings between all element pairs. Assume unit voltage
>(in phase) on all elements. Solve the matrix equation and you get the currents
>and phases. I did something like this as part of my Master's Thesis work
>(under W8JK, none the less!)

RL:
Absolutely, it can be predicted. The required equations are the ones I mentioned above, but of course expanded to the required number of elements. And feed systems can be, and are, designed for just about any current ratio (magnitude and phase) you could want. (See for example Jasik, Johnson, the writings of Carl Smith or Paul Lee, or the series of articles by Forrest Gehrke mentioned earlier in this thread.) And if you twist the knob of just about any network in just about any feed system, it's possible to predict, i.e., calculate, the resulting element currents and the pattern. But I maintain that it would be very difficult to achieve predictability the other way around. That is, given two elements in which you want to vary the phase from, say, zero to 180 degrees while maintaining equal magnitude currents (or equivalently, two elements from which you want the null to rotate as you turn a knob), can you come up with a network or feed system that will do it? (My interpretation of the original question is that this is what was wanted.) The problem with doing it is, of course, that the feedpoint impedances vary as the element currents change. A network that would do the trick is one that would deliver to two or more elements a specified current ratio (magnitude and phase) which wouldn't change as the element impedance varieds. I firmly believe that, except for zero and 180 degree phase, such a (passive) network doesn't exist.

This reminds me of an effort I made to get a ham to donate a radio to a non profit group. I was able to show him that he could deduct the thing for three times what he would get in cash netting a significant improvement in "profit". "No way...I want cash." even though he would have made, bottom line, about $150.00 more by donating it to a charitable organization. I can provide the formula for doing the breakeven calculation if anyone is interested.

This will work if the person donating the equipment is making itemized deductions. However persons making "standard" deductions are unable to deduct individual items on their tax form. (at least what I have expericned over years, I'm not a tax expert). I have been making "standard" deductions for years. The itemized deductions are great if you own a house/business/property. These persons are more in a position to donate and benefit from it. The average blue class worker is probably better off getting a cash sale.

IMHO of course!

As Roy knows, I believe this too since in this context passive means a passive reciprocal low loss network. (Any network made out of just capacitors, inductors, transformers is reciprocal.) I believe that you can force equal currents at any phase shift if you use, for example, an ideal circulator. Finding an ideal circulator is, of course, left as an exercise for the reader. I posted some notes on this at http://fermi.la.asu.edu/w9cf/articles/magic/index.html if anyone is interested.

Brand New Portable Antenna Analyzers for sale.

Active VSWR meter giving direct readings of both VSWR and % reflected RF power.
It is designed to check the exact resonent freq. of any antenna, HF, VHF & UHF.
It has a 4 digit freq. counter and an analogue meter, with a switch for 2 freq.
ranges and 2 knobs for freq. adjustments, Fine & Coarse.
It has major advantages over a standard VSWR meter in that it sees the antenna
system exactly as the Transmitter sees it, plus the frequency is swept to see
where its resonating. Makes trimming so much quicker and easier !

For further info E-mail RTE
at rte@iafrica.com

Have Q7A and VX1R..... the VX1R in my opinion is a better radio after
the software mods..... oh well, just my opinion.....

3552. Re: TM-741A Low power out on 2M

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-06 00:00:00 UTC
From: Garth <DarthVader4@hotmail.com>
Message-ID: <35F1EC82.9D4D538C@hotmail.com>
Source record: 132787

I've worked on two of these radio's with that exact symptom.... actually the two meter output was very low (not the other bands) and it turned out that the two meter rf module needed replacing. Got new one from RF Parts.... the problem seems to stem from the mfg (kenwood) not putting any conductive greese on the module (heat conduction that is) and the heat is not sinked to the heat sink properly.... if you find that the present module is ok and the problem lies elsewhere, take your module apart when you get some free time and add some heat conductive greese to the modules.... it will be well worth the time and effort in the long run..... These are GREAT radios.... Good luck with yours.... most people never part with them when they get one.... this is evidenced by the scarceness of sales on the net.

Cross-posted to:
rec.radio.amateur.boatanchors,rec.antiques.radio+phono,rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.swap

I have for sale a Hallicrafters SX-101 Mark 3. This one is a great example of Hallicraftersï¿½ first receiver produced to exclusively cover the Ham bands. Covers 160 thru 10 meters, 14 tubes, dual conversion, crystal calibrator, S-meter, selectable sideband, ANL, BFO, and Notch filter. This SX-101 MARK 3 is in beautiful cosmetic and operational condition, chassis is very clean. Less than normal top scratches, faceplate is beautiful. Tuning knob has two small chips in the outer rim, otherwise, front panel appearance is near perfect. Overall, I rate 9.5+. With original ownerï¿½s manual. This receiver is very heavy, approximately 75 pounds. Guaranteed not DOA, otherwise sold "as-is". No warranty implied.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewItem&item=28676420

Thank You,
David

: get public key! http://keys.pgp.com:11371/pks/lookup?op=get&search=0xBCE296A9

The SMA-3 has been ok for me...a hint-if you put a piece of shrink tubing
on the antenna at the point where the base meets the flexable whip
portion, you will avoid much of the flexing(along with the invitable
bend).
The first day I used my SMA-3, it got slightly bent at that point....so I
straightened it out and stiffened it as above...no more problems!

3564. Icom IC-T8A

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-06 00:00:00 UTC
From: roncook@worldnet.att.net
Message-ID: <35f363c7.473361837@netnews.worldnet.att.net>
Source record: 132799

Hi!

I purchased an Icom IC-T8A yesterday only to find the instruction manual is printed in Spanish!
My dealer indicated the problem was known to him and arrangements had already been made to replace such manuals.

In searching for another method of programming I inquired about the PC-programming option, learned it was currently in-transit, and would be available by the middle of this coming week.

My question: If anyone has one of these units might I ask you to post the programming sequence to place one frequency (with offset and repeater PL) into one memory location ?

I worked with the radio for a while yesterday using experience (and some common sense) gained from programming the RS HTX-202 and -242. It appears that I did 'get it right' but would like to see the actual sequence.

Normally, I wouldn't post a question such as this; however, I'm working a local race tomorrow (Monday) and the T8A is replacing a saltwater-logged HTX-202.

Thanks for any assistance!

Hi
I am looking for someone who may have a schmatic to ID the IC used in the Swan 600R.
The IC is on the notch filter circuit. It is located on a small board just below the S meter. Not sure if this is the original one, but the number on is is FX-60. This may be a later revision or add on. What it does is narrow the SSB frequency.
If you have the rig let me know the chip number on yours.
Thanks
EJ

One of the most important things - to me anyway - secure or not.
Our neighborhood watch groups are allowed to utilize some of the
secondary police freqs, and they have DVP stuff...
(OK, I know we can add the remote secure box, but those are
tough to find. It's easier if the rig is already capable in
firmware).

Exactly. Solid copy to a JX yesterday evening at 28.010 with 35 watts
using a 22 year old rig, a 1/4 wave ground plane and practically no
filter to speak of. If y'all don't want to bother with 10 meters
because of QRM, I'll be happy to have the extra clear space. The band
is far more usable and QRM far less obnoxious than 20 meters with it's
100,000 watt California and PR flamethrowers blazing away at 500 wpm
and overloading the front end of this rig to the point where I can't
hear my neighbor. 10 meters rocks.

>
>Is this correct? Is the cable suppose to only be a 3 conductor cable? Or
>am I missing a crucial part?

The 3-conductor plug is used for programming the FT-51 (and probably
the FT-11 and FT-41) via the earphone jack. There should have been
a short adapter with a 4-circuit plug and 3-circuit jack in the box
as well. You put that on the end of the main cable when programming the
FT-50 and VX-1 through their 4-circuit jack.

Sounds like the adapter cable is missing from your package.

>geographic areas would, of course, be best.

Most activity centers around local repeaters. The ARRL Repeater
Directory should list all of the coordinated repeaters in your area.
(It is a pocket size book, you should have it if you travel.) That's
the first place to start. Many repeaters are sponsored by local
radio clubs. That's the second place to look. Find your local clubs
and show up at a meeting and ask about local activity. (Ask people
you meet on the repeaters about the meetings.)

You can also try 146.52 MHz simplex. That's the national
calling frequency, and is sometimes monitored locally.
(Not always, though, even that varies from place to place.
Your area may have different favoritefrequencies for
simplex use.)

Repeaters and local simplex frequencies are the "watering
holes" around which the local amateur herds gather. They
are the natural places to meet other amateurs on the air.
And like real watering holes, the activity tends to peak in

the mornings and evenings.

>Also, I was surprised how little chatting there is going on during
>commute hours. Maybe people are tired and hurried, but it seems to me
>that exchanging information about (auto) traffic would be a good idea,
>as well as having an emergency frequency. Of course, maybe that's too
>much like CB?

At least on our repeaters, we try to discourage the usual grousing about traffic by razzing those who do it. We try to encourage each other to talk about something *else* so that we can get our minds *off* how bad the traffic is. There's a place for traffic spots, but if that's all you talk about, it quickly becomes boring for most of us, and just inflates the road rage of the rest.

As I said originally, the only way to get interesting conversations going is to talk about interesting things. Find something interesting to say and you'll be surprised at how many will join you. This may not be easy at first (conversation is an art), but as you find out more about the interests and activities of those who frequent the repeater, it will become easier.

Each repeater develops its own personality based on those who frequently gather there. Some repeaters will have personalities with which you are comfortable, some won't. You'll develop your own preference for certain groups, and will hang out on those repeaters. If they all seem dull and nearly dead, you'll have to take the lead in reshaping the repeater's personality. If you are constantly rebuffed by one group, find another. (Do remember that you're the new kid on the block and don't be too pushy.)

On our machines, we make it a point to avoid formalized roundtables. We operate interrupt driven. This makes conversations less stilted and more lively. It does lead to doubling, so keep transmissions short and encourage a lively back and forth flow of conversation. Also, don't be afraid to allow the repeater to go silent from time to time. It is perfectly alright to just ride along in silence until someone has something to say.

Other repeater groups may be more formal and use a strict roundtable rotation. If that's more your style, then go with those groups. I find them very stilted and boring, but maybe you won't. They are a way to get people to talk who don't know each other very well, but they are death to lively back and forth conversation.

One final note, remember that you're talking to *people* not stations. Talk to them like you'd talk face to face at the water cooler. Call them by name and reserve use of call signs for ID at the legal intervals.

Source record: 132832

Has anyone noticed that the Yaesu programming cable (for the FT-50R, in my case) also works fine as a level converter for ICOM radios? The Yaesu cable has a built-in level converter (a little circuit board with a bunch of surface-mount parts in packed inside the DB9 connector), and it is apparently perfectly compatible with ICOM radios as well. Hooked it all up to my IC-746 using shareware control software and it works great!

Just connect sleeve to sleeve, and connect to data interface connection of the Yaesu plug (can't remember which one it is off hand, but it is listed in the Yaesu instruction manual. It's the connection with about 3.5 volts on it) to the tip of the Icom mini phone plug connector. As I said, works great and was a pleasant surprise. Saves me the trouble of building my own...

3606. Kenwood TH-79a 4 sale/trade

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-06 00:00:00 UTC
From: Robin <"rastoma 'at' chatt.net">
Message-ID: <6sv2o0$u6u$1@camel29.mindspring.com>
Source record: 132841

I have a Kenwood TH-79a dual band HT that I would like to sell or trade. It is good condition... it does show signs of normal use... the most noticable being some light marks on the plastic LCD cover. The symbols on the rubber keypad are not worn off like some you might have seen.

Includes Kenwood PB-32 battery (600mAh)
Kenwood brand dual rapid charger (worth $100 by itself).

I got this radio a year ago from a local EMT driver whose had it since it was new, but misplaced the paperwork during a move. So all I have is the battery, radio and charger. If you have used this radio before then you will familar with it's operation, if you have not, it does have a menu system that will help you with most of the functions.

I'm looking for best reasonable or would like to trade for a 9mm pistol depending on brand/model... or maybe even a .40.

Robin

> I have dealt with Murray and would have to say that anyone NOT reading
> a post of his is missing some great deals from a true ham.

What does this mean? "a true ham" Are the rest of us false hams?
Do you know how long he has been a ham? He is a rookie.
I have gotten better deals. He is not the only dealer around trying to
make money. Sure he is cheaper than AES, or the other large dealers,
but I prefer to buy from the owners and users of the equipment. They
know the history of the gear. He just buys it to sell it. Not that there
is
anything wrong with that. But he's not the messiah of radio.
Have a happy day.
Jim

From: Michael Tyson <mtyson@concentric.net>
Message-ID: <6svar3$nbo@chronicle.concentric.net>
Source record: 132846

Chuch,

Couple of ways you could do it:

Use a RF actuated T/R relay to disconnect the scanner when you key the radio. Or, if you're not scanning in the same frequency range as your 2M rig, you could use a diplexer and connect the 2M rig to the appropriate port and the scanner to the other port. You'd have to make a choice what frequency range you scan though, but the scanner wouldn't be disconnected at all - you'd still be able to receive while transmitting on 2M - BUT you'd have to make sure you're well isolated.

Source record: 132852

I am a radio neophyte who is planning a minor purchase primarily for contact with a buddy in a rural survival or urban emergency situation where we will be rather close. I would like your advice. Am I making the right choice here?
I have the opportunity to get 2 FRS (half watt) radios a n d 2 CB radios (4watt out/5 watt in)...all are handhelds....for $220.00 total, new.
My logic n doing this instead of spending the same money for a 2 meter is that in an emergency situation, repeaters would probably be inoperative and simplex would be the only way to communicate anyhow.
Plus I'd need 2 hams at at least $350-$400 for the pair or more.
For the money spent, am I making the best choice in light of my reaso for having the radios? I also have DX-394 s/w receiver as well as an inverter allowing operation off the car battery or from a battery alone.
Thanks for any advice!
JD

Source record: 132854

In my case I was able to use the programming cable from my Icom IC-W32A HT
with my Icom IC-751A!!
It works great with any software that I have tried with the 751A! It sure
saved me the expense of buying the overpriced CT-17 unit. Granted the CT-17
lets you connect to 4 radios but it is very expensive for a little box. I
received the software and programming cable for the W32A FREE when I bought
the HT. I wonder if CT-17 sales will fall now?

Several years ago, I saw 25 of these units at the surplus
yard at Alameda Naval Air Station. I tried to round up
some interested parties in order get a group together that
would like to get one. I did not want to bid on the entire
lot for myself as I had no room to store them.

From what I saw, they were NICE rigs. !!!

Source record: 132858

I just recieved a Tentec Argosy 509 from my father in-law.
However, I don't have a manual. While I'm trying to track
a manual down, I was hoping someone could answer some questions.

There are 2 RCA phono jacks, one labeled "antenna" and the
other "rec. ant.". What's the difference? What impedance
are they?

There is a 1/4" phone jack for a microphone. What kind of
microphone does it take?

I'd love to get this rig on the air within the next few days.
Any help would be appreciated.

Message-ID: <35F29F81.D58B18AC@scan.missouri.org>
Source record: 132859

First I'd try a Radio Shack snap-on ferrite choke, and place it first on the

key line as close to the rig as possible. Try rerouting the keyline. You
didn't
say what kind of antenna and feedline you are using. You may have RF
currents wandering from the antenna back into the shack VIA the outside of
the shield of the coax, if that's what you're using. A choke balun at the
antenna, and one just outside the house on the feedline could help. If
you're antenna is near the house, as on the roof, you may be inducing RF
into the house wiring where it wanders around on all AC wiring and on your
rig's chassis....Good Luck finding the cure.

3625. Re: Problems with Icom IC-756

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-07 00:00:00 UTC
From: Seth Miller <seth.miller@NOSPAMworldnet.att.net>
Message-ID: <35F4363A.9A496519@NOSPAMworldnet.att.net>
Source record: 132663

Sounds like the problem might be in your power supply, not the rig. When you transmit, the radio draws much more power than on receive. If you have a weak power supply or perhaps just a poor connection somewhere the voltage will drop when you attempt to draw more current. This drop in voltage will cause the radio to shut down, which removes the high current draw, which restores the voltage at the radio, which causes it to turn back on. Until you try to transmit again, that is. There is also the possibility that radio has a shorted component somewhere in the transmitter that is drawing excessive current, but look to the power supply first. Should be easy to sort this out if you have a multimeter with voltage and current measuring capabilities.

Please note that the voltage will probably appear perfectly normal under low load conditions, the problem will only show up when you attempt to draw more current than when on receive.

Just a suggestion...

- Seth N6BMB

Well stated ... same is often true in Hurricane season ... check out 14.325
the next Hurricane and see where the National Hurricane Service turns for
reliable on-the-ground
data.

Ham radio is valuable if Hams make themselves valuable -- and dies if we
retreat to selfish and narrow pursuits ... listen to most of CB ... yes,
that same sick attitude is occasionally present on Ham bands because the
FCC fails to enforce the laws ... we need to start demanding that they
return to enforcement or nothing will save the hobby from CB-selfishness!

Hello and thanks for reading this. I purchased a used TS-850 awhile back and love it. The manual that comes with it is ok, but what I'm looking for is any resource or any neat hints and kinks for this rig. For example, using the memory banks, using the slope tuning, recorded messages, etc. I know these ideas are covered in the manual, but what I'm looking for is real life examples of how you have used the bells and whistles in the Kenwood 850. I would be willing to compile your ideas and post them in various ham spots on the web. Any mode, dx features, ragchew, etc will be of interest.
Come on, I know there are lots of other 850 owners who would like to hear how you use this rig!
Thanks and 73!

It is an excellent radio. You can use ICOM battery packs on it. The
best feature though is the fact that it can only receive in the 70 cm
band. It does not have "extended receive" capabilities. This makes
it EXTREMELY IMMUNE TO INTERMOD. If you live in a city with lots of
450 MHz pager traffic, then this is the one to have. They're also
extremely cheap these days. Don't pay more than $100 for one.

3645. Source of info on rigs online?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-07 00:00:00 UTC
From: David Nye <nyeda@uwec.edu>
Message-ID: <35F48D94.4279@uwec.edu>
Source record: 132683

As a fairly new ham starting to think about upgrading from my TS-520, it is frustrating to read ads for used equipment and not know any details about the model being sold. I know there are a few books out there that catalog rigs, and about the ARRL's Product Reviews online. The QST reviews are useful when trying to make a final decision but not when I'm scanning lists of classifieds as they take too long to download. Is there anything online that provides a short description of most of the commonly traded discontinued radios? Perhaps as a FAQ for this newsgroup? Thanks for any pointers.

73,

I agree.
ASCII is the standard for email and news.
But meanwhile there are a lot of people around who think that WWW equals
the Internet. These WWW-yuppies don't know about the netiquette and basic
principles of the Internet.
At last the Internet spirit of the early days will vanish as the ham
spirit is about to.
Sad story ...

Cheers,
Detlef.

I hope someone replies that knows more than me, but here goes. I believe you can get 220 from 2 110 circuits in your house but Id do some research before I tried it on my own, That stuff can fry you! Try electrical code books in your library or talk to a local electrician. Any heavy duty appliances in your house (like electic oven or dryer) are probably 220. I dont think there is an easy way to convert it without getting inside your radio. If comfortable doing this look to see what voltage the transformer inside is converting the voltage to..... You might try looking for "radios that glow in the dark" or one of the other groups that mess with tubes. Good luck and be careful, the ARRL books used to have good safety tips for working inside radios. 73, art KF7GD

Check with people who have been through a disaster. In almost all cases the Cell Phones become useless. During these times priority is given to long distance connections, and others in a descending priority. The local connections aren't useable because of the flood of people trying to use them. Guess which lines the cell phones depend upon? We also had a fire in a local phone facility that killed nearly all cellular traffic for almost a week. In 1996 there was flooding severe enough to cause problems throughout the area. In a number of smaller surrounding towns, flooding completely cut off the towns physically from the outside world, no business radio, or other emergency services, including cellular traffic. In this instance, Ham Radio was the ONLY source of communication for almost four days. Cellular circuits are limited at best. How often have you received the message network busy - wait? Imagine a disaster where everyone tried to use them at once? We have even had a recent major failure of the radio systems of the Police and fire radio systems. Some type of software failure of the trunked systems. Isn't high technology wonderful?

To prepare for an emergency, acquire as many methods to communicate as possible, including cell phones. Then use which one works when needed. The beauty of ham radio is that most ham's use their equipment regularly, and aren't surprised when the critical need arises. Many hams are also regularly involved in emergency service groups.

3661. need help with TS-940S Memories

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-07 00:00:00 UTC
From: ki3b@delanet.com
Message-ID: <6svbte$7c8$1@nnrp1.dejanews.com>
Source record: 132715

Hi,

A buddy of mine has purchased a TS-940S for his shack. Evidently, when he tries to put frequencies in the memory channels, they're not going in.

We're selecting the frequency in the VFO mode and am pushing the mem-in button. We have also tried having the rig in the memory position and pushing mem-in, but still no luck.

Unfortunately, the rig didn't come with the manual (yes, I know, first mistake...)

a) are we doing this memory write procedure wrong??

b) has anyone fixed the memory switches on the front panel?

c) could this be a problem caused by a low backup battery??

Any help would be appreciated....

73,

Joe KI3B

It is a complicated story.

Don is assuming that because a pointer to E-bay is being
used that the set is not For Sale but is For Auction.

The original seller is assuming that because he had
the thing on auction that the information and photo will
remain there forever.

Neither is correct.

Duh! It was meant to be humorous, fool. But opportunistic egomaniacs such as yourself jump in and try to make someone else look foolish just to pump up their own egos. There appears to be quite a lot of this behavior in this newsgroup by just a few participants.

Don't dish it out if you can't take it, little boy. This is my last posting regarding this topic. I apologize to the rest of the readers of this newsgroup for the bandwidth that has been wasted on this topic. Now, resume studying CW and quit whining about what must be done to obtain a real ham license. It's time to throw away the training wheels.

Dave,

I am in the process of finishing a CAT program for the FT-8500. It will run under Win95, and is basically the MH-39 keypad on your screen, with all the functions enabled. There will be shortcuts, though, like being able to just type the AN tags for the memory channels, etc.

When I finish it I will let you know, it should be about a week now.

Cheers,

Mike

3678. Re: Yaesu Programming Cable Works for ICOM CI-V

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-07 00:00:00 UTC
From: Philippe <pserrano@pratique.fr>
Message-ID: <#QcyZfj29GA.386@ntawwabp.compuserve.com>
Source record: 132732

Hello,

In the same way, I'm trying to find out if the CAT 232 Yaesu Interface works with Icom radio ?

I own a Yaesu FRG100 with the level converter interface (CAT interface) and I'm planning to buy an IC 746. Both radios have Din connectors and need lever converters in order to be connected to RS232c interfaces. So, it will save some bucks if I could connect the Yaesu interface to to the Icom trx :-)

If anyone has similar experience or tried to connect a yaesu interface to an Icom radio, please jump in :-)

Bye,
Philippe
F4BXI

>Has anyone noticed that the Yaesu programming cable (for the FT-50R, >in my case) also works fine as a level converter for ICOM radios? The >with a bunch of surface-mount parts in packed inside the DB9 >connector), and it is apparently perfectly compatible with ICOM radios >as well. Hooked it all up to my IC-746 using shareware control >software and it works great!

Brian,
He's referring to the way the message was posted as "for sale", when it's actually up for auction on e-bay. Many people (including myself) feel that this is improper etiquette, since it misleads the reader into thinking that the sale is a, for lack of better words, regular sale, when the item is actually up for auction. Some folks don't care to engage in the online auction process, and would rather negotiate a private sale with out the influence of outside bidders.
Personally, I think that Mr. Honeycutt should have mentioned in his message somewhere, preferably in the title, that the item was being sold via auction. He didn't mention that anywhere, the only reference was the link to the E-bay URL.
I think that many would agree that there's nothing wrong with soliciting bids for E-bay items via Usenet, as long as the seller presents his posts accordingly.

3680. Yaesu Control cable for CI-V

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-07 00:00:00 UTC
From: wcarc@hotmail.com
Message-ID: <35f3d091.4592444@news.itcanada.com>
Source record: 132734

Word of caution:
The cable works fine - BUT
The levels send to the CI-V device (scanner, etc...)
are slightly (mabye .5 volts) higher.
This probably won't make a difference worth beans, but it's something
to consider if your radio starts freaking out on you.

Source record: 132736

Looking for a nice, good working IC-706 or 706MKII at a reasonable price. A CW filter would be a plus but not necessary. Please reply via email with what you have and whats included.

Source record: 132738

I use a duplexer made by Pro-Am (model D270). I run the scanner off of the UHF port. The signal is attenuated on the VHF public service band, but since those signals are strong at my location it really doesn't matter. The 2 meter rig, even running 50 watts, doesn't seem to bother the scanner any, even the VHF signals.

I'll try to expain this again. The radio is
FOR SALE. It WAS on Ebay several
weeks ago, but didn't sell. The gentleman
is using the OLD ebay address to show
a PHOTO of the unit. The auction is long
closed with NO BUYER. The radio is
being sold on the open market, it is
for sale, not auctioned. If anyone bothered
to check, the ebay address is no longer
valid. I follow most Hallicrafter auctions
on Ebay since I collect Hallicrafter sets.

3686. Problems with Icom IC-756

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-07 00:00:00 UTC
From: r.s.eckman@larc.nasa.gov
Message-ID: <slrn6v7o17.2lt.r.s.eckman@dobson.larc.nasa.gov>
Source record: 132740

I've just begun experiencing a problem with my ICOM IC-756. When pressing the PTT button on the microphone (or the transmit button on the rig), the power cycles off and immediately back on. In other words, the rig does not transmit at all and any attempts to transmit cause this power cycling. The rig has been fine since its purchase last autumn until now. I tried connecting a dummy load with no effect. I don't see any other obvious problems.

Has anyone experienced this problem with the Icom IC-756 or similar rigs? Thanks, in advance, for any assistance.

Very simple. It has been asked repeatedly to please place reference to either E-bay or auction in the header so folks know whether it is "for sale" or auction.

In this instance, once again, it is marked "FS" when it indeed is not.

>JD

That's probably a pretty good plan, though if you can afford it, you might
want to buy GMRS radios instead of FRS radios. They run more power,
which will increase your range, and can also do splits for using GMRS
repeaters, if those happen to still be working when you need them, and
allow you to connect an external antenna, which can greatly extend your
range. The CBs are good backups, get SSB models if you can. They have
greater reach, and can still do AM too. It would be a good idea to get external
antennas for both radios. The rubber ducks they come with aren't all
that great and a full size antenna hung high over a tree limb will greatly
increase your range. Note, the FRS radios have permanently attached
antennas, so you can't do this with them. The GMRS radios will have
connectors which allow you to do this with them. The CBs may or
may not have provision for external antennas, get ones that do if
you can.

I know you're currently looking at a deal, but look closely, you might
get more value if you look for the things I've mentioned. It might cost
a little more, but you'll have more capability too. You need to determine
battery life too, so you'll know how many spare batteries you might want
to carry, or what to do about keeping rechargeable batteries hot and ready
to go. For radios primarily intended for emergency usage, I'd look for the
capability to use alkaline batteries. They have a better shelf life than
rechargeable batteries, and can easily be swapped out in the field
when necessary. There may not be a charger nearby if the rechargeables
go dead on you in the field.

Amateur radio is probably the wrong choice unless both of you are
also interested in amateur radio as a hobby. You must have an amateur
license to use amateur radios, and there is a test, though not a hard
one, to get the license you need. FRS and CB don't require licenses,
and GMRS only requires you to send in a form to get one (there's
a fee, but no test).

Even though your purpose is emergency/survival, you want to be
legal to avoid hassles, and to allow you to practice with the equipment
before an emergency occurs so you'll be familiar with its operation
and limitations. Amateur radio provides you with that opportunity,
because you may wind up using the radios every day for hobby
purposes. That's a good emergency preparedness feature. When
you're in trouble is not the time to be fumbling with a radio whose
operation isn't intimately familiar to you.

You sure that's not an Argonaut?

>There are 2 RCA phono jacks, one labeled "antenna" and the
>other "rec. ant.". What's the difference? What impedance
>are they?

The one marked antenna is for transceive operation. The one
marked receive is to allow you to use a separate receiving
antenna, ie no RF comes out of it on transmit. They are 50
ohms nominal impedance.

>There is a 1/4" phone jack for a microphone. What kind of
>microphone does it take?

600 ohm dynamic.

3700. Re: TM-741A Low power out on 2M

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-07 00:00:00 UTC
From: Phil Wheeler <w7ox@ix.netcom.com>
Message-ID: <35F40EC9.3C2D3CD3@ix.netcom.com>
Source record: 132754

Mike,

YOur user manual should have come with a schematic.

I have a TM-742, a similar but newer, model. Each of its band modules does have a power adjustment for med and high. On 144 module it is VR3, a 10K pot.

Since the 741 and 742 use the same band modules, VR3 should do it for you. The bad news is that it may not be accessible with the radio assembled and operating. (just inspected a spare module I have, and it is not marked on the module's exterior housing).

I suggest you call Kenwood service and get their input on this.

Phil

I beg to differ with you. At this time, the radio, e-bay item# 28676420, is very much up for auction. Bidding is at $175, the reserve is not met and there are 3 days and 6+ hours left. I had verified this prior to my post last night, as I was aware that this there was some discussion on this item previously. I also believe that this item has been offered for private sale at $275.

Hi Regis,

I think I can make you a copy of the disk that I got with my TWD 120, if you are interested. Please send me your address.

BTW, I have it connected to a SCSI card. Can you connect it to a parallel port? If so, how? Do you have any technical details? Do you know what the performance trade-offs are?

Thanks

Frank Suraci

From: al@boltons.demon.co.uk
Message-ID: <35f5c04c.3792625@news.demon.co.uk>
Source record: 132513

Hi,

I recently acquired a Standard C-628 440/1.2 GHz handy but it is faulty. It produces no audio on 440 MHz and low level audio only on 1.2 GHz. When in repeater/duplex mode it seems to produce normal level audio.

The set works mostly OK otherwise, although it can be reluctant to respond to key presses which seems to imply a fauly or poor connection to the ribbon cable joining one half of the set to the other.

It seems sensitive enough as well. Can anyone suggest a cure for this problem? Failing that, who would you recommend to fix it (preferably in Europe as I am in the UK but if needs be the USA)

Thanks.

Al

3713. Re: Emergency Communication - Ham vs Cell

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-08 00:00:00 UTC
From: Jim Robinton <rci@mv.mv.com>
Message-ID: <35F5D850.8DC3D7EB@mv.mv.com>
Source record: 132516
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.policy

I have been following this thread a little.

Like most "systems" when compared to other "systems"
each has its strengths and weaknesses. I think we all
understand how very usefull a cell phone can be, I don't
use autopatch anymore to report accidents unless there
is no-one else coming by. If my child were injured I
think I would want to attempt the cell phone first, then
if there was no luck there I would be very glad to have
the ham radio as a backup.

An attempt to characterize without being judgemental.

Cell Phones:
Strengths:
o Very quick access to the telephone network
o Best for small (personal) emergencies.
o Network is growing and making them more useful.
o Can be used by general public

Weakness:
o Can be overloaded easily.
o More rural areas lack coverage (range)
o Infratructure susceptible to damage.

Ham Radio
Strengths:
o Knowledgeable operator knows to move to high ground.
o Less dependent on infrastructure (some repeaters are A/C only though)

Weaknesses:
o Can take longer to aquire frequency to use (repeater).
o Autopatches are not generally "OPEN".
o Requires licensed operators.

(Please add your own to the above). When TV arrived radio
did not go away, but it did change. With cell phones here ham radio
will probably not go away, but needs to change...progress like cell
phones can be good. Me......I have both decided I like having both
a cell phone and a ham radio !

The codes come from the telegraphers of yore. They would use common (to the telegraph company) codes to shorten the traffic. There are lists of them out on the web in telegraph history pages and in some ARRL publications. There are even codes for the various holiday greetings.

Optoelectronics has a tiny freq cntr for $99.00. I haven't tried it myself, but from specs looks like a good BASIC cntr. (i.e. not many advanced features, and I'd wonder about how linear its response is across its 1.4Ghz range).

What it really has going for it is that it is mounted inside a standard Motorola pager case. I would consider it as a good 2nd meter.

I couldn't agree with you more. I went into the local mall located
RS today (a corporate store) picked up a few parts and asked about a
catalog. The response was "that'll be $2.95" and I just said "I'll pass".
It's their loss.

I also have a shelf of catalogs that I regularly use and make purchasing
decisions from. I've not paid one penny for the privilege of ordering
from any of 'em.

3725. Re: 110 volt to 220 volt converter?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-08 00:00:00 UTC
From: CommQuart <commquart@erols.com>
Message-ID: <6t4sno$6og$1@winter.news.erols.com>
Source record: 132528

This was discussed in the Rec.Antique.Radio+Phono
newsgroup a few months back. The general consensus
was to be very careful when using a 220 volt line, as
both sides of the line will be hot to ground when doing so.

They're giving 'em away in Portland, OR.
I asked what it took to get a catalog. The new guy told me $2.95.
I said, "no thanks, I'll browse it here." When the manager entered earshot,
I mentioned that the buzz on the web was that they got so much flack that
they were now giving 'em away. New guy said, "no." Manager grumbled
a bit and decided to give it to me.

A simple 2:1 ratio AC transformer will easily double your 110 VAC line voltage to 220 VAC, and provide isolation from the power line also.

The other concern I would have is if the radio will be unhappy with our 60 Hz AC line frequency, since the standard in Europe is 50 Hz. I'm willing to bet that someone out there subscribed to this newsgroup will have a useful opinion on that issue. . .

I borrowed a Icom IC706 MK II for the weekend from a buddy of mine. It seemed to me that the rig ran (even while just receiving) awfully warm. It was so warm that even while just sitting there receiving, the fan constantly cycled on and off.

Is this normal?? Has anyone had similar experience with the '706?

Thanks,

Joe KI3B

Hi,

I am trying to get, or at least for now fighting with. a Radio Shark SWR meter. I am having trouble getting reading. I have connected the wires on the remote senceor the way the manual sails you should do. When I got to the SWR mode the numbers dance around, and don't settle down. Same thing with the power, I have the power set to the auto power, vs 2kw. and still no luck with that either. If someone one on the board has one of these things, and more importantly has gotten it to work, I would really appreciate some help.

Thanks Zach Seattle WA (KC7KRO)

See above.

> If the point of it is to get your license to use HF then the service
> is over with.

Personally, I'm hoping that 6 meters will attract legions of current Technician licensees to wonder what HF might be like as the sunspots increase over the next five years. I think we'll see a ton of new HF activity.

> Everyone has a cell phone so the service aspect in terms of
> catastrophes is fading fast. Kill all of my power and I can still
> communicate.

In the L.A. area, cell phones saturate immediately when anything out of the ordinary occurs. The network has little capacity for sudden surges in demand.

> Yaesu, ICOM, Alinco, Kenwood have a shrinking base of customers

I believe that they amortize some of their R&D costs for mobile and portable gear across their commercial lines, reducing the cost of adding a ham-band unit to their lineup. HF rigs are perhaps another story, but they don't cost nearly as much to design and build as VHF/UHF gear (see above).

Hello All,

I am interested in purchasing an aviation style ANR headset. I was considering the David Clark (http://www.DavidClark.com/)noise attenuating headsets (or similar brand). What I want to do is use an aviation headset with various amateur radio gear, especially for contesting. I don't mind making up adapters and foot pedals for keying the radio, and would even consider building up a small amplifier or impedance matching device if necessary.

Any opinions, advice, or comments?

Dan

Hummm, I seem to remember an airliner crashing on Long Island a few years ago(no, not TWA 800). With all the emergency services, and news crews using cell phones, all the cell sites got so jammed up that calls either got dropped, or users got a busy signal for hours on end. I know amateur radio played a big part in this...maybe someone from the Long Island area could expand on this one.
As far as "EVERYONE" having a cell phone, this is not true. I'm one of them that has yet to purchase one. The simple fact is that service is limited to populated areas, and major interstate roadways here in central/northern NY State. Two or three cell carriers verse access to 20-30 2mtr repeaters and 10-20 440 repeaters in a 30 mile radius. Cell phones maybe the "trendy" thing to use in metro USA, but it still has along way to go in rural USA. Take your pick in times of an emergency...I'll take amateur radio hands down!

Eric in Central NY(State)

3746. DC Power conversion 15 volts to 12 volts

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-08 00:00:00 UTC
From: jomurphy@plains.NoDak.edu
Message-ID: <6t3ii2qom1@node2.nodak.edu>
Source record: 132627
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,comp.sys.misc

I want to build an external transportable battery supply for my laptop computer. I have a rechargeable 15 volt battery from an old Motorala handheld 'brick' (was used in the old vhf mobile telephone service about 10 years ago). My computer input either from a power supply from the wall or from a car cigarete lighter takes 12 volts. Could I safely use this battery? (Probably not, so on to my next question---) I want to convert the 15 volts to 12 volts to safely use it. In my old radio building days (about 20 years ago) I knew there was a way to do this, but now I am not too sure how to use the Ohms's law to convert down. I do know it may only take a couple of resistors and maybe a diode or two (OR am I talking ancient equipment here????) Can anyone help me out with a circuit to do this? Would be appreciated!!!

BTW: For those curious, it seems my internal batteries are always giving my low battery indications after about 20-40 mins of use (even tho manufaturer suggestions say 1-2 hours. Tho most of the times I can use the power cord, there are times when it just isnt convenient to do so (like when I need to do some work and will only be on for about 30-45 mins).

Any help is greatly appreciated in advance.

You can either post an answser here, or (preferable) email to the following:

John Murphy
murphy@warp6.cs.misu.nodak.edu

The reason for posting from a different email is that the one I check all the time wont let me post to the newsgroups (tho I can read them). So I use a backup email address for this. Again, thanks in advance for any help anyone can give.

John Murphy

>FCC fails to enforce the laws ... we need to start demanding that they
>return to enforcement or nothing will save the hobby from CB-selfishness!
>73, DavidC AA1FA

Indeed that is the problem with ham radio today and in the future.
Enforcement. frankly a bill that allowed and required the FCC to
collect (in lumps at renewal) a few dolars a year form us Hams and to
reserve it for neforement, would do more for Ham radio than any Bill I
have seen lately

When outsiders look at Ham radio, Like I have too as part of
my job I see clumbs going every which way, and nothing worth the
trouble of planing to deal with. This is also dangerous to Ham radio

<snicker>

The problem with the cell system, at least the analog cellular systems, is
that due to the way frequency reuse is organized each cell is strictly limited
in the number of simultaneous calls it can support. The cells are arranged
in a hexagonal matrix, and no frequency can be reused within 3 cells of
another. That means each cell can only support 6 simultaneous calls
before all the available frequencies are consumed.

CDMA digital cellular avoids this problem and can have as many calls
per cell as there are spreading sequences in use, or as there is trunk
capacity from the cell site to the central switching point. Since the number
of possible spreading sequences is very large, the practical bottleneck
is simply trunk capacity to the central switching site. That's one of point
to point microwave or fiber or copper twisted pair. The latter can be a
serious bottleneck, but the former two can supply a large amount of
trunk capacity. So as cellular systems convert to digital, and as microwave
or fiber trunks pick up the interties, the capacity of the cellular system
will expand to be sufficient to handle a much heavier traffic load than the
current AMPS system can support.

Note some systems use TDMA digital instead of CDMA. They can't support
as much caller activity per cell. And like AMPS, they hit a hard limit where
you won't get dialtone when they run out of slots. With CDMA, the system
doesn't hit a hard limit. Instead it degrades gracefully as usage increases
and everyone's SNR degrades. So the connection becomes noisy with heavier
usage, but doesn't hard limit and lock you out. (Okay, it can hard limit when you
hit central office switch capacity, but the others hard limit way before that due
to the less efficient way that they share the RF spectrum.)

You'd think that all the cellular providers would switch to CDMA, but many
of them are more concerned about maintaining quality of service, ie a certain
guaranteed SNR for each call, than they are about maximizing system capacity.
And some are just more comfortable with TDMA than CDMA since they have so
much experience with TDMA on their trunks while having virtually none with

CDMA. (Different network traffic management strategies are required for CDMA than for TDMA and AMPS.)

Even though you *might* be able to connect to the battery directly, the easiest thing to do is to use two power silicon diodes in series to drop the voltage by 1.4v to 13.6v, which is about what the car would provide when it is running. BTW most battery specs are made assuming the drives are powered down most of the time.

3760. ****For Sale: Icom IC-Q7A Tiny Dual bander HT! $170

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-08 00:00:00 UTC
From: John R Alley <chia@korrnet.org>
Message-ID: <Pine.GSO.3.95.980908152803.13722A-100000@clarion.korrnet.org>
Source record: 132641
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I have a 3 month old Icom IC-Q7A that I would like to sell. It
is a GREAT little HT. I used it mainly as a scanner. IT is a GREAT scanner
with RX from 30MHz-1300MHz of course has cell blocked. It has 200 channels
with many many different scaning options for pause, hold, resume, etc...
I have had both the VX-1R and this Icom and the Icom is 10 to 1 a better
HT. You can mix and match any freq. in any of the 200 channels with no
computer mod required! Loud audio compared to the VX-1R! It is the same
speaker in the FT-50R series from Yaesu in this IC-Q7A! Excellent HT. Of
course it will TX from 140-150MHz (factory from Icom) and from
440-450MHz. Excellent radio.... excellent intermod rejection, and noise
rejection. I have the box manual and all paperwork. I even have the warranty
card not filled out yet. The reson I am selling is I don't need it anymore
I got a new HT, and a scanner as a gift. I will ship it to CON US 48 states
however you wish. E-Mail for more info etc.... I am asking $170 for the
ht. Thanks.... E-Mail me at one of the bellow addresses for more info.

Hello,

can anyboby tell me the correct pin connection between Kenwood's TM-V7A Data connector and the PC Com-Port (RS-232). In the U.S. is a special cable available called PG-4S, which should work with that new Software at www.kenwood.net to save and restore the Memory-Channels at that rig with my PC.

You can't buy that cable here in germany (said Kenwood germany) so I have to made it on my own. The Software is for free.

Note: I DON'T mean the connection of the packet-radio cable PG-5A !!

You can answer here, or via www.qsl.net

John D. Seney, WD1V, said:

> Everyone has a cell phone so the service aspect in terms of catastrophes
> is fading fast. Kill all of my power and I can still communicate. This
> is 1998 not 1967. Eisenhower is dead - admit it!
> John D. Seney, WD1V

In June of this year, Elam Stolfus, TG7XQS, said on 20 Meters:

"Armed bandits kidnapped my wife, daughter, a nurse, and a visiting missionary. Ham radio is my only means of communication to the outside world. Can you help us?"

Ed Petzolt, K1LNC heard the call for help, and amateur radio went to work.

Armed gunmen had kidnapped four missionaries from a compound in northern Guatemala. Among those held for 2-million quetzales (around $300,000) ransom were the Barbara and Anita Stolfus, the wife and daughter of Elam Stolfus, TG7XQS, and two others, including Otto, a missionary from Belize, and a nurse, Jenni. Missionary Elam Stolfus promptly turned to ham radio, his only connection to the outside world, and K1LNC and TG7XQS coordinated operations of the Guatemalan police and armed forces. The bad guys lost, and all the hostages were returned safely. Try that on your cell phone!

3766. Need advice to build radiophone

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-08 00:00:00 UTC
From: Vesa Matikka <vmatikka@iwn.fi>
Message-ID: <6t43vasqo1@news.clinet.fi>
Source record: 132647
Cross-posted to: rec.radio.amateur.equipment,uk.radio.amateur

I'm looking for advice how to build somekind of (amateur) radiophone.
Does someone have schematics for such unit,range longer than 50 kilometers
with normal phoneline quality.

I have no radioamateur experience,but have constructed other electronic
devices.

If someone from Finland reads this,I would like to hear what law paraghraps
there is about using these devices (in Finland)

I appreciate all replies and advices.

Please post your answer to this NG and to my e-mail.

Thanks !!!

> Is the HTX 404 a good radio?

The only thing I didn't like about it was the transmit-receive
turnaround time was something like 500 milliseconds or more.

I took it back for return and bought an ADI AT-600 dual band radio.
You should be able to get a HTX404 for less than $100 if you can
find one.

Message-ID: <6t48g7$sc@safety.ics.uci.edu>
Source record: 132653

You may be using the "peak" reading function, and using SSB to
trigger the SWR meter? The Radio Shack meter says it will read
PEP, but it will NOT. That is why they sold them at $16.95 last
I saw them for sale. It is a good meter for CW, just give it
a carrier and it works fine. If it doesn't do this for you,
I have no idea what is wrong. Get another one if they have
any left :-) .

Many modern homes have 220 volt wiring to the circuit breaker panel. You could run a circuit from there to power the radio. However, it would probably be less expensive to buy an adapter from one of the electronic dealers such as Radio Shack, or get a 120 to 240 volt transformer (appropriately rated) from an electrical supply house. I do suggest that someone thoroughly familiar with electrical wiring and the local code regulations advise you if you decide to buy a transformer or do some wiring.

Are you saying that any analog cell can only handle 3 calls at a time?
Where did you get that?

Cell calls are not dropped due to overloading.
The cell site can handle a
maximum number of calls at any one time. Once the cell capacity
is reache, the next caller attempt will not go through.

Cheers,

with normal phoneline quality.

What frequency range? That will make a difference.

>
>I have no radioamateur experience,but have constructed other electronic
>devices.

Hams built devices like this years ago. Now it is cheaper
just to buy. The 11meter CB radios are very easy to convert
to 10 meter amateur radio frequencies. I believe that they
are FM in Europe.

>
>If someone from Finland reads this,I would like to hear what law paraghraps

I have the following for sale/trade....

<1>
dx 390 radio shack sw reciever with
box manual ect....almost new works well and no blemishes

$70 +shipping

<2>
mfj 451keyboard keyer with keyboard,
wall adapter, manual, box, keyinput

sells for 99 in the mfj catalog, street retail?

$45 + shipping

<3>
mfj 564 iambic key paddle wired with
a stereo jack to be used with any iambic
keyer to get dits on one paddle and dahs
on the other

$29 +shipping

<4>SOLD
IC 22S

<5> SOLD
radio shack digital power meter.

<6> SOLD
tug 8

<7>
d104m6 mobile amplified mike
7 volt battery cage broken, you can
get another from astatic for $2.00
no connetor for radio

$20 shipped

<8>
I also have about 2 dozen 4 wire
mike cords. These are the heavy duty
belden cables that I bought surplus cheap!
I will pass the cheap on to you

these normally go for 9.95 each

$3.00 per cable shipped

<9> sold

<10>
matched pair of mrf497's I was going to build a radio
with high output but the idea fizzled...***note these are the
high output transistors that are used in the hr2510/hr2600/htx100
high output mods****
I also have a matched pair of mrf492's that I was going
to build into a 6m amp, but am going the route of a
larger output radio.

497mp $45
492mp $45

<11> Radio Shack scanners,
pro 2035 1000 channel scanner with excellant recieve
25-512/760-1300mhz
$200

pro 2045 200 channel scanner 29-54/108-174/216-512/806-1000mhz

$120

or I will take partial trades
I am NOT opposed to trading up or down
or buying outright

looking for....

KAM version 7 or later with software/cables

6 meter radio will consider allmode

10 meter FM ONLY radio ie azden....regency 88
2kw or better tuner with wire/and dual coax outputs
and meter

ham IV or bigger rotator

I can be dealt with, if you have trades, let me know

km5rt@ticnet.com
I LOVE THIS RADIO STUFF!! remove the read47usc227beforespamming
to reply. I hate spam, and will delete it. thanks
Pursuant to 47 USC 227, any spam, harrassment, or any type of
unsoliceted mail will be forwarded to my collection agency
for a $50 fee per message. This modest fee recovers the
time lost reading the meaningless message, the brain time
to figure if it was meaningless, the disk space used until I
had time to figure, and the time and effort that it took to kill
the OFFENDING message.

If you like CW use it! If you will not be doing CW on the ham bands, 13 WPM is probably fast enough for the test. 20 WPM will only get you 75 khz of space for voice for MUCH time and effort... you weigh the effort to gain ratio...it is YOUR choice!
I am presently active on. 160-10 meters ssb voice,packet,SSTV and fm where allowed, 6mssb,6mfm,2mssb,2mfm packet,2mfm simplex, 220fm,432ssb,440fm,440fmpacket and whatever else I can find.

3783. FT-101 Serial Numbers Explained!

FT-101 Serial Numbers Explained-

There are almost 15 combinations of FT-101 transceivers made during
the 1970's. See what model you have. Get the Serial Number, then:

http://www.qsl.net/nw2m/ft-101.html

Example: There were 3 runs of FT-101E models! (Early, Mid, Late) Then add the
fact that there were E, EE, and EX sub-models!

Gotta' have the Serial Number. A Late model E is worth MORE than
an Early model (as there were 3 MAJOR circuit board changes).

We have for sale one Kenwood TS440S/AT. The radio has hardly been used, and comes in the original box with user's manual and hand mic.

The radio has had the extended TX modification done to it.

We are asking $600US or best offer, buyer pays shipping and prepays with a US International money order.

Pictures and specs for the unit can be seen at http://www.bcfmca.bc.ca/ts440.html

We can be contacted at bcfmca@'nospam'bcfmca.bc.ca (please remove the 'nospam').

Thanks.

I have an 850 which I think is the V70s predecessor.

The fuse block inside my car had an extra unused terminal (20 or 30A - I can't recall) so I was able to get power with out diffculty or holes.

I tried several different comet trunk lid antenna mounts and they all fell off - somehow opening and closing the trunk made the attachment screws vibrate out of the mount - I even used lock-tite with the same result.

I wound up using Larsen TMB brackets to mount the antennas.

The radio is remoutely mounted in trunk and the control head bracket is held up by the trim screws on the panels under the glove box. Cables are hidden behind the same panels.

Hope this helps.

3789. Re: Cell Images on IC-Q7A ?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-08 00:00:00 UTC
From: Joe NW0A <*NW0A*@juno.com>
Message-ID: <01bddae7$c1488da0$763dd3cf@dr.-lizard>
Source record: 132704

For what it is worth:

While scanning the reallocated frequencies from TV
channel 19 with my Q7A (a very active public service
band in and around LA), I came across very annoying
images from transmission in the 800 MHz cell phone
band. Spending 5 minutes generating signals between
870-894 MHz with the loud 1st mixer LO output in my
Alinco X10 (very handy piece of test equipment for those
of us that cannot afford a 1 GHz RF frequency generator),
I discovered that there is a one-to-one relationship between
reception of "illegal" cell phone frequencies and that shown
on the Q7A:

Cell Frequency = 1.5 X (Q7A Frequency) + 133.3425 MHz

That is, setting the Q7A to 503.105 MHz will receive the image
of the cell frequency of 888.00 MHz, or putting it another
way, scanning between the edges 491.105 & 497.345 MHz
with a 20 kHz step on the Q7A will pick up cell images between
870.00 & 879.36 MHz with a 30 kHz step.

Seems that iCOM has done it to me again with their inferior
equipment, making scanning local public service frequencies
with my Q7A impossible because of annoying and illegal cell
phone images. Is it any wonder why I dissaude anyone I know
from purchasing from iCOM because they consider their
customers as beta-testers who pay for the privilege of finding
obvious mistakes in their radios? (The IC-706 is a prime example.)

The reason HTML goes against netiquette in Usenet has little to do with
the way it displays in any particular newsreader. The reason is that it
does not display well on ALL newsreaders. You've got to admit it's pretty
rude to leave someone out of the discussions because he doesn't share
someone else's idea of which newsreader is best; even if the discussion
is meant only for those that use that particular newsreader, anyone who
wanted to win converts wouldn't be successful when the converts couldn't
read what they were saying.

> you don't know, do you ?

I receive many catalogs free that have not only pretty pictures advertising the seller's products, but useful information and interesting stories as well. They receive prominent places on my bookshelves, which gets their name seen by me several times a day (a marketer's DREAM). I, in turn, recommend their catalogs to my clients, who usually end up buying from these companies.

If Radio Shack wants me and my clients to look at pictures of their wares in their high-quality publication on quality paper, they will either make it worth the price of a good magazine to me, or they will give it to me at no cost to me and consider it to be part of their advertising budget.

Perhaps all those years of REQUIRING name/address/phone number to buy a battery, then sending their high-quality publication on quality paper to everyone who buys a $3 battery once a year, has caught up with them. Or maybe the marketroids who glide around Corporate all year chanting, "I can sell AIR! I can sell AIR!" have taken it too much to heart and begun to gloat that people will pay $4 to get their advertising. Whatever it is, at some point someone there will realize this isn't the Victoria's Secret catalog and this isn't working, and they'll start trying to get their advertising distributed as widely as possible to a properly targeted market instead of what they're doing now or have done before.

You'll find that experienced reporters know what most cell phone users
don't; each cell can handle only so many calls. In time of catastrophe,
the cells get so overloaded that calls get dropped. I've heard many
emergency services managers talk about it, laughing at stories about the
reactions of cell-phone users during events that were small but still
very newsworthy.

From: stuartm@aztec.asu.edu
Message-ID: <6t6ru1$e91$1@nnrp1.dejanews.com>
Source record: 132467

I am working on a Yaesu FRG-7 with a VFO failure and was hoping
to find some one that's had the same problem. Q403 is not
oscillating. Both Q403-osc and Q404 are good yet no signal is at
TP404. I suspect one of the smaller caps in the oscilattor circuit
and would like to hear from others that have done the same trouble
shoot.
.
Many Thanks,
.

3803. Best mobile setup with a HT without a permanent install?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-09 00:00:00 UTC
From: yung@NOSPAM.lansol.com
Message-ID: <35f6dd93.3920617@news.ncal.verio.com>
Source record: 132468
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

What's the best mobile setup with a HT without a permanent install?

I sometime drive a company car (my boss's Mercedes) and obviously don't want to drill any holes, glue anything, and make any "permanent" installs to the car. What's the best way to utilize a HT and best removable mobile antenna?

Anybody tried the Maha Docking Booster? Does that require installation?

Thanks in advance.

I am looking into getting a legal limit or close to it amplifier and would like to hear pros/cons for the following tubes: Eimac 3cx800a7; one or two? Eimac 8877? Amperex 3-500G; one or two? Am considering the following Ameritrons in no particular order of preference: AL-1500; AL-82; AL-1200; AL-800H. Which one would be the most rugged and not be too critical of tuning up? Any recommedations would be appreciated. I know, they are not an ALPHA!! But for the cost of an Alpha I can get two nices horses and a trailer, plus some ham gear!

3808. Re: Best Dual Band HT

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-09 00:00:00 UTC
From: Hembiel Grossliede <fresmol@gripsear.net>
Message-ID: <6t6r5nrga1@news3.mr.net>
Source record: 132473

After owning many dual band HT's I have a few opinions. The Yaesu FT 530 is argueably the best do all, reliable, drop on the floor and still work HT ever made. The Icom IC W2A is close and I like the Alinco DJ 580, although the 1st RF xistor in the 2 meter side is weak and likes to pop. You should be able to get the 530 for $200 or little more, the W2A for $250 and the Alinco, I've seen for $180.

If you must have a new one, I know less about them but notice that the trend seems to be going back in time. Kenwood and Icom both have units that don't cross band repeat, don't let you listen to both channels at once and in general are 15 years behind in technology. I'd stay away from them.

> I sometime drive a company car (my boss's Mercedes) ...

Check out the suction-cup window mounts that cradle HTs (and cellular phones) that Radio Shack is now carrying. No holes...just a Kleenex(tm) to clean the windshield a bit before and after...<g>

> Anybody tried the Maha Docking Booster? Does that require
> installation?

It would be more difficult to install - because of its weight and size. Also - the suction-cup moun I mentioned above can be adjusted so that your antenna is at the height of the window...as opposed to sitting on a console or armrest.

- Clint Bradford

Well Joe, I think you need to consider what you really want. I've tried the VS-1. The c508 and the Q7A and they are not SCANNERS. They are dual band amateur rigs and therefore maximum performance would be achieved inside these bands. The fact that they will receive other frequencies is just a plus. A quality scanner costs 400-2000 dollars. What can one expect from a less-than-200 dollar radio?

There are two separate classes of dual-band HTs.

One class might be called "full-blown dual-band". These radios have
two of everything - they're basically two single-band radios in the same
case with some common control logic. They will receive on both bands
simultaneously, and will crossband repeat. They are the most flexible
type of dual-band radio.

The other type might be called "single receive dual band coverage".
These radios contain VCOs and power amplifiers for both bands, so they
can be used equally well in both bands. (The FT-50 even has a third
RF front end for 800 MHz receive only). But this type of radio cannot
receive more than one frequency at once, and cannot do crossband
repeat. You can't have a full-duplex conversation with someone else.

The "single receive" radios are built with the same technology as
the "full dual" ones - they are not 15 years behind. If you only
want to listen to or talk on one frequency at once, they work
fine. They also have lower battery drain during receive, are
typically smaller, and cost a couple hundred dollars less than the
"full dual" radios. Several of them are sufficiently sealed to
be "weatherproof". They are different from, but not inferior to,
the "full dual" radios.

Dave

Joe,

I have a IC706 MKII that I purchased new back in Nov'97. To accurately answer your question I would need to know what your meaning of "awfully warm" is. My unit's fan starts cycling on/off after approximately 30 minutes from being turned on. The fan cycles about once every 3 to 5 minutes. The fan defaults on when in transmit. The case of the radio is warm, not hot, similar to an old "tube-type" radio. Hope this helps.

3831. Re: IC-746 cross-band duplex

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-09 00:00:00 UTC
From: Seth Miller <seth.miller@NOSPAMworldnet.att.net>
Message-ID: <35F5E4F1.FC0E22B1@NOSPAMworldnet.att.net>
Source record: 132538

Yes, cross-band duplex operation is possible with the IC-746 and it is easy to program into the radio (not 'full' duplex of course (Tx and Rx at the same time), although you might be able to accomplish this with some mods if you wanted to). Only two limitations that I have discovered thus far:

1. You must use the same antenna (i.e., if you are using antenna 1 you cannot automatically switch to antenna 2 when you key up).

2. If you have the internal antenna tuner activated, it stays activated on both transmit & receive. This can cause a slight reduction in sensitivity on receive if you have it tuned to the Tx frequency and the two bands are far apart. Can be solved by simply not using the internal antenna tuner, or manually switching it off on receive.

Other than the above, works great. No problem working the RS satellite in semi-duplex mode on 10/15 meters, etc.

3847. CS-2100 (for Icom 2100H) Cloning Software *.ICP files

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-09 00:00:00 UTC
From: "Terry G. Glagowski" <glagowsk@kersur.net>
Message-ID: <35F63BD2.6CC64D7E@kersur.net>
Source record: 132554

The CS-2100 cloning software for the IC-2100H
has preset files (*.icp) which allow you to load
channel information into a portion of the memory bank.
I've figured out, by looking at the example files delivered
with the installation disk, how to set the frequency,
duplex +/-/0, offset amount, CTSS tone freq, PL tone freq,
but NOT the channel name, tone off/PL/CTSS, and skip on/off.

Does anyone know how to set the channel Name,
Tone Off/PL/CTSS, and skip channel on/off attributes
in the *.icp (preset) files? Also... do you happen to know
more about the format of these *.ICP files.
(they look like a field number, followed by a colon,
followed by a value, fields numbered from 01 to 08)

I've figured out that the *.ICF files are more-or-less
a HEX dump (translate 'g' to '0', 'h' to '1', etc and you'll see)
of the IC-2100H memory... and you can experiment
with the settings of the various channels in the CS-2100
program to see what the various fields do. Basically
each memory channel takes 16 (0x10) bytes, with
some additional information (channel skip) in a single
block of bits later in the file.

I could write my own software to manipulate the *.icf
files, but I would rather use the *.icp files to customize
my 2100H for various mobile trips, but I really need to be able
to set those channel names, and PL tone enables.

Using the search engine deja news do a search on GAP Vertical or GAP challenger. Hundredsa of messages will appear. This has been discussed endlessly. Might save a lot of digging around...

BTW I have one. It is an adequate first antenna but a simple 80 meter dipole fed with ladder line through a tuner will do a much better job.

3849. Re: DC Power conversion 15 volts to 12 volts

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-09 00:00:00 UTC
From: richg@one.net
Message-ID: <35f5e145.48475229@news.one.net>
Source record: 132556
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,comp.sys.misc

If you were talking about a Ham rig, I'd have all kinds of
recommendations. For a laptop, I mostly have questions.

First, I'd verify what the computer really needs. What does the
manual say? Does it run directly off the cigarette lighter socket?
When you're talking about automobile batteries and systems, 12 volts
is not exactly 12 volts.

If the computer will run off the cigarette lighter while the engine is
running, then your "15-volt" battery may be fine as is. Auto ignition
systems commonly run 14 to 14.5 volts when the engine is running.
Long after you've shut the engine off, the battery settles down to
anything from 12.7 to 13.2 volts. So "12 volts" is a nominal value
at best.

If your 15-volt battery is indeed 15 volts and your computer indeed
needs 12 volts, then the safest way to connect the two may be to use a
3-terminal voltage regulator. Several kinds are available that have
different current capabilities. 12-volt, 1-Amp regulators are easy
to come by, and the mail-order houses have them up to 3 Amps.

One regulator will provide reliable 12-V output with no additional
components.

But first try to determine what voltage and current you really need.

Well, Rick, it ain't necessarily so. There are some interesting quirks in the
internal revenue
code that may prevent a person from taking ANY itemized deductions. Check out
form 6251.

Also, if you ask the IRS, you'll probably learn that you can't deduct more than
the value of
the item. So, if you deduct more than you can get in a cash sale, you're
asking for trouble.
Something about tax fraud, prison, etc. Those penalties can really add up.

So, don't condemn a person without knowing ALL the facts of the situation.
And don't try to twist a person's arm to break the law for the benefit of your
favorite charity.

I don't even own a cell phone; I'm going by what people who have been in
the situation have told me has happened to them. I (and they) can speculate
all over imagination's great territory about why it happened, but they say
it happened repeatedly and to many of the people around them as well as
to themselves.

One possible wild-assed guess, totally unhindered by knowledge or facts,
is that the data channel overloaded from the sheer number of phones in
the small area. Another would be a bug in the cell firmware that only
shows up during periods of stress.

3854. Drake TR-7 Accessories FS

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-09 00:00:00 UTC
From: ki3b@delanet.com
Message-ID: <6t5ga6$gj1$1@nnrp1.dejanews.com>
Source record: 132561

Hi,

I have several accessories for the Drake TR-7 that I'm parting out:

All prices plus shipping from 19701.....

Drake RV-7 VFO - $150/BO

Drake MS-7 Speaker - $60/BO

Drake Phone patch for TR-7 - $100/BO

Drake Speech Processor for TR-7 - $100/BO

All are in good shape. At least an 8 on a scale of 10.

Stuart:

I know that it's big brother (RCI 2970) should only be used when accompanied by an external low pass filter. But, this advice is probably valid for any HF rig. There is a lack-luster internal filter in the unit. RCI is under indictment by federal authorities; so parts could be a future problem.

I have the following NOS tubes available - since I no longer have
equipment that uses them:

1 - 2E26 $ 4.00
2 - 6DZ4/6AF4A $ 3.00 ea
7 - 6AK5 $ 2.00 ea
2 - 6AK6 $ 2.00 ea
6 - 6BH6 $ 2.00 ea
6 - 5763 $ 6.00 ea
3 - 6360 $ 5.00 ea
2 - 6939 $20.00 ea
2 - 7360 $30.00 ea
1 - 7551 $ 5.00
1 - 8156 $12.00

All tubes are in original boxes in good condition.

Please add $3.00 for packaging and priority shipping per order. I will
also consider offers for the entire lot, but will sell one at a time
plus $3.00 shipping (if you want more than one, shipping is still $3.00
total for the order).

Thanks,

Al - K8EUR

I've been dropped during a call. My guess is that I couldn't be
handed off to the next cell because it was at capacity. I do know that
local cell sites have very low capacity -- in the neighborhood of 20
calls or so. So the cell networks get clogged up at the slightest "event"
such as a snow storm.

Hi John,

With no knowledge of commercially available DC to DC Converters manufactured for you application I suggest the following:

Go to your local public library and look up ARRL publications.

The Radio Amateurs Handbook has a chapter devoted to power supplys.

There is a section of this chapter that gives the info you desire called "DC TO DC' converters.

I would suggest that you follow this circuit shown with a 3 Pin 12 Volt regulator circuit also shown in this chapter.

Anyone know of a commercially available 12 vdc to 15 vdc converter??

What was the room temperature? My IC706 MkII also warms up while receiving but the fan works only from time to time at approx. 22 C. However as soon as I transmit, even with 40 watts only, the fan works quite frequently.

Hello, world!

I'm looking for the following parts for a Hallicrafters
S-107 general coverage receiver:
- Dial glass
- one of the large knobs (main or bandspread tuning)
- chrome nameplate trim piece that goes below the dial
and has the main and bandspread tuning knob shafts
protruding through it (terrible description - sorry!)

I will buy a complete radio if I have to, but I'd rather
just buy the parts I need to finx up the one I have now.

I'm also looking for a copy of the Owner's Manual, Sams
Photofact folder (if there is one), and any other kind
of literature, magazine ads, and so on. I have a copy
of the factory Service Information manual already.

Thanks and 73!
Dean - K5DH

3875. FS: Icom IC-751 Immaculate condition, little use

Newsgroup: rec.radio.amateur.equipment

Message-ID: <35F69F06.577639F6@frl.orst.edu>
Source record: 132582
Cross-posted to: rec.radio.amateur.swap,rec.radio.amateur.equipment

I have an Icom IC-751 that does not have a scratch on it. I have original box/manual/mike. This rig was used mostly in the late 1980's then very little since then. I have logged all my contacts and this rig has been used to work just over 1000 contacts, mostly short duration DX. As a result, it has not had a great deal of use.

I power up the rig every few months to make sure everything is in proper working order. Because I did not want the added heat load on the rig, it does not have an internal power supply.

Also included: RC-10 remote control unit. (keyboard for direct frequency

entry).

Price: $575.00 FIRM

If you are looking for an excellent, non-DSP rig with a lot of useful features that won't overwhelm you, this is a good rig for you.

At room temp (78 deg) mine runs warm to the touch in receive and hot to the touch during xmit. The fan comes on/off during receive and on when transmitting. Considering the small package, this appears to be normal. As many MkIIs that are out there, if there were a heating issues, Im sure everyone would know about it by now.

>Are you saying that any analog cell can only handle 3 calls at a time?
>Where did you get that?

No, reread what I said. A basic AMPS cell can handle 6 simultaneous calls. Here's why. There are 366 cellular channels. Half of them are assigned to the wireline carrier and half are assigned to the non-wireline carrier in your area. So any one cellular system only has 183 channels. It takes a pair of channels for a duplex call, so there are only 91 available duplex pairs. (These numbers are from memory and may not be exact.) The cells are arranged in a hexagonal matrix with no reuse for spacings less than 3 cell widths in all directions. That leaves each cell with a maximum of 6 pairs to use, plus a control channel. So each cell can only handle 6 calls at the same time. (A sectored site can handle 18, and one control channel, most sites are sectored today.)

Cell sizes are regulated to supply adequate capacity for a given population density. In other words, in densely populated areas the individual cells are made smaller, and there are more of them. In sparsely populated areas, the cells are bigger, and there are fewer of them. There can also be supercells with 40 or more channels, but these are used only in the early stages of a build out, or in very rural areas for a very high site. There can also be microcells to handle very high density areas. For example, during the Olympics in Atlanta, multiple microcells were setup at the various venues to ensure adequate capacity for those surge events.

Digital cellular allows more calls to be handled per cell. The TDMA systems do this by slotting the available time on the available pairs. This can multiply the capacity of the system several fold by making better use of the available bandwidth. CDMA cellular offers an even better way to multiplex the available spectrum, and can handle a much higher traffic load before the SNR gets too bad to be usable (generally about 8 times more than TDMA). CDMA is also resistant to multipath, so annoying picket fencing and dropped calls are reduced.

With all these combinations, the cellular carrier can lay out a system which will handle normal traffic patterns (since not everyone calls at once). But a usage surge, such as may happen with a major event or emergency, can have more people trying to call than there are cell pairs available. Then you get no dialtone if you try to place a call until one of the cell pairs is freed by someone hanging up.

The cellular providers have a backup plan for this. They can throw a switch (software switch) in the control center to prioritize calls. Certain numbers assigned to public safety, fire, ambulance, hospitals, etc, then have priority. If a phone with one of those numbers comes up on the control channel demanding a pair, an ordinary user will be bumped and that pair given to the priority caller. (This same priority system works on the wireline network too, which is capacity limited by intra-office and inter-office trunk capacity.) This lets critical official calls go through even in a widespread emergency or heavy usage surge. This is a fairly new capability, and isn't widely used by official agencies yet.

But the fly in this ointment is that John Q Public's calls don't always go through, and his call may be attempting to call for help from the authorities. If John Q Public can't reach 911, then the emergency response system breaks down because it depends on the public to call so that dispatch can know where to send response units. The real bottleneck in emergencies is the 911 dispatch center. When it becomes overloaded, the public can't be served by emergency response units because the public can't let the dispatchers know that they have an emergency.

Unfortunately, there isn't a whole lot hams can do about this. Their calls have to funnel through the 911 dispatch center too at some point, either via a phone patch or by a ham relaying the call from his home phone. That won't be a priority number, and it isn't guaranteed to get dialtone, or to not get a busy from the 911 center even if it does get dialtone. And there's the problem of interfacing the public with the hams in the first place. Generally, the public won't know to contact a ham if their phones don't work, so emergencies don't get reported and response units don't get dispatched.

Cellular system capacity is being increased rapidly, the prioritized caller system is being implemented for the various official agencies, and cellular systems are being hardened so that they stay up in emergencies. So these systems will become more and more the backbone communications method for emergency responders. A few public safety departments have already switched to cellular instead of upgrading their existing radio networks. This trend may grow as the cellular networks mature.

In the past, hams have concentrated on two areas with respect to emergency response communications. One is to act as liaison between different public safety and public service agencies. But that role is being displaced by the priority calling aspect of the cellular and wireline systems. The other role is to act as additional eyes and ears for the response agencies in the community. That role is still useful, and would be more useful if there were a well known mechanism for the public to take advantage of it to make requests for emergency response units. (A lot of organizational work is needed in this area.)

Hams also play a role by providing logistic communications for volunteer agencies such as the Red Cross, Salvation Army, etc, as well as augmenting

logistic communications for some government agencies. Since the volunteer agencies don't have prioritized phones, and not all government agencies have them yet either, they have to depend on the alternative communications hams can provide. Hams have done well in this role, and are likely to continue to be needed in this role for some time to come.

Many of them have a problem with the PLL. When you power it up, if the display shows ..... the PLL needs to have some glue removed and a some parts replaced.

It is a simple job, but very labor intensive. You could easily pay $200 for the repair.

The glue was used to "pot" the PLL, to isolate it from temperature changes and mechanical shock. Over the years, the glue absorbed moisture. The glue needs to be removed by scraping with a sharp knife. There are a few parts that MUST be replaced and often other parts are damaged by the corosion. It is also likely that even a skilled hand will damage a part or two and they also would need to be replaced.

If you want more information look at www.kenwood.net under amateur service bulletins.

The later ones did not have this problem, someone here may be able to help you if you can get the serial number.

Geoff.

>it happened repeatedly and to many of the people around them as well as
>to themselves.

There are two possibilities. One is that if they are in motion, they move into another cell which doesn't have an available pair. This is the most common cause of a dropped connection. The other possibility is that they may have been bumped by a prioritized phone user. The cellular system (and the wireline system too) has the capability to assign priorities to various numbers, and they can bump ordinary users when a priority call is required to go through.

>One possible wild-assed guess, totally unhindered by knowledge or facts,

It is very unlikely that the data channel could be overloaded, and it is even less likely that there is a bug in the firmware which could do this. There is probably no such thing as bug free software, but the systems have been stress tested very thoroughly, and it is unlikely that a bug which results in dropped calls, lost revenue, would have been allowed to remain in the cell code. It is somewhat more likely that such a bug might exist in some manufacturers' phones, however. Because of time to market pressures, they may not have been debugged as thoroughly as cellsite code.

You could, if you had a *satellite* cell phone. Currently they cost about as
much as a HF ham rig, but prices are falling, and as the Irdium system
comes fully on line next year, prices should plummet to the neighborhood
of terrestrial digital cellular phones. Per minute usage charges will still
be higher, but the service is global.

It should also probably be noted that much of the second and third
worlds are leapfrogging the copper twisted pair era of the first world
and are going straight from no phones to cell phones as their primary
telephone system. This is *much* cheaper to install for country wide
service than would be a copper web. We've been held back from doing
it here by the enormous sunk costs of the existing copper network.

> Looking for opinions on which is the the best dual band HT and why.
> Must be at least 4 watt.

Not to be argumentative...but your question is wrong...<g>

The absolute best dual-band HT? Why, the Standard 2m-220 unit, hands down.

But it might not be the two bands you're looking for.

More pertinent answers could be given to you if you were to tell us what area of the country you live in, and what YOU need from a HT.

Is an HT's size a concern? Do you need 100 memories? 200? Do you like to play with your home computer - so much that computer programming of your HT is attractive? Will you be working events? Just calling home and friends? Do you travel a lot in your car? Commute a long distance?

No one can really help you with your original question unless they know a little more about you and what you want out of this magnificent hobby.

- Clint Bradford, KE6LCS

P.S. - But I REALLY like my Yaesu FT-50RD and Standard C-558a 2M-440 HTs...<g>

Generally, things designed for 50 Hz work fine on 60. 60 Hz requires
less iron in transformer cores and *less* capacitance in power supplies,
so 50 Hz stuff is under less stress when operated on 60 Hz, not more.

One exception is anything that depends on the line frequency as a
source for timing info. Clocks will run too fast, induction and
synchronous motors will run too fast, etc.

>calls. Here's why. There are 366 cellular channels. Half of them are
>assigned to the wireline carrier and half are assigned to the
>non-wireline carrier in your area. So any one cellular system only has
>183 channels.

This doesn't make sense to me. Each carrier gets about a 10 MHz block
of frequencies, which is about 360 channels *per carrier* at 30 kHz
spacing. The other carrier has its own 10 MHz block.

>It takes a pair of channels for a duplex call, so there
>are only 91 available duplex pairs.

But the base and mobile frequencies are 45 MHz apart. Each carrier
gets an *additional* 10 MHz block of frequencies for the reverse direction
channel. So by my counting, each carrier has about 360 frequency *pairs*,
and thus 360 duplex channels (before you start swiping control channels).
That's four times as many as your math started with.

Assuming the rest of your analysis is correct, that would leave about
24 channels (calls) for a non-sectored site, and 72 for a sectored site.

Of course, that's still not enough to handle all the people who would
want to call during a major disaster.

>CDMA cellular offers an even
>better way to multiplex the available spectrum, and can handle a much
>higher traffic load before the SNR gets too bad to be usable (generally
>about 8 times more than TDMA). CDMA is also resistant to multipath, so
>annoying picket fencing and dropped calls are reduced.

What happens to range in CDMA? It's my impression that as additional
calls come into a cell site, the noise floor rises, and the transmitters
increase power to compensate. Once a small handheld phone at the edge
of the coverage area reaches maximum output power, can't its S/N
degrade to the point of dropping the call?

It would seem that there will be some areas that are "within range"
of a CDMA cell site at times when traffic is low, but which seem to
have no coverage when traffic is high, even though that site still has
channel capacity available to accept calls from a higher-power or
physically closer phone.

If not, what am I missing?

Dave

> with normal phoneline quality.

Vesa-

Your requirements would most likely be met by a commercial Cellular
Telephone. For an Amateur to provide that capability, it might be
necessary to duplicate a Cellular Telephone system using Amateur
frequencies. Clearly, using a commercial Cell Phone would be MUCH less
expensive!

If you wanted to use a single base station, an approximately 250 meter
antenna height would be required for 50 Kilometer range, for
"line-of-sight" communications to the portable phone. Such a system might
work most of the time, but would not be as reliable as a Cellular system,
and would not have phoneline quality at the more distant points.

In other words, what you want is somewhat ambitious. If you must persist,
I suggest you look for technical information such as found in the ARRL
"Radio Amateur's Handbook". You may find answers to your questions there.

This is like asking how high is up.

The best DB HT for you would be determined by your needs. Without knowing them any answer to you would be near useless. Try talking with Hams in your area, possibly attend a meeting of your local ham club and ask what they like and dislike about their radios. Ask if they bought another one what they would consider important capabilities, and why.

Try to get another ham to allow you to use his radio, with his instruction and help. This will allow you to first hand see how they work.

Most hams, myself included, couldn't operate all the functions of fancier DB HT's they own without step by step reading from the manual. In short many buy for the ability, all the bells and whistles, and rarely use them.

The LM338K Three terminal adjustable regulator will, with proper heat sinking, provide up to five amps of current. The external components required are minimum, and it is a simple circuit to construct. The data sheet available from most vendors has a suggested circuit. This would work great for you, with the added value of being able to power 9v and other levels.

Good points, but there's just something wrong about paying for a
CATALOG that will help you pick out stuff to BUY in the future.

You may be correct. I was doing all those numbers from memory. I
could have easily been mistaken.

>increase power to compensate. Once a small handheld phone at the edge
>of the coverage area reaches maximum output power, can't its S/N
>degrade to the point of dropping the call?

Yes, it certainly can. The cell site firmware is pretty intelligent about handling this, however. It will command the nearer phones to reduce power further. So their SNR degrades a bit, but the noise floor also drops a bit, so the fringe station can still get in. That keeps the degradation with loading graceful for all users.

CDMA phones have a lower low power limit than AMPS phones. They can be commanded literally down into the microwatt range. This is a very different philosophy than AMPS uses, or than amateur radio operators use. We typically just jack up the power rather than considering that we could get others to reduce their power. (In practice, of course, other amateurs are usually unwilling to reduce power to accomodate another user, but the cell phones have no choice, they have to do as they are commanded.)

>
> Weakness:
> o Can be overloaded easily.

Yes, but TDMA and CDMA digital expands their capacity, and the
ability to prioritize service can allow critical calls to bump ordinary
calls in an emergency.

> o More rural areas lack coverage (range)

I don't know if I believe this. There are many times when I'm out
of range of 2m and 70cm repeaters, but only a few times that I've
been out of range of cellular, and then only for a short distance.
That's true around Atlanta, and it is also true up at my farm in
rural Kentucky.

> o Infratructure susceptible to damage.

Sure, but not as much so as the average amateur repeater.
Cell sites are built to rigid commercial specifications, amateur
repeaters often are not.

>Ham Radio
> Strengths:
> o Knowledgeable operator knows to move to high ground.

OTOH, the knowledgeable cellular operator may know to move *off*
of high ground. With cellular, you'll generally find it advantageous
to drop a few yards below the crest of the hill so that you'll be blocked
from interference from the cells covering the other valley. That'll often
let you capture a cell when you can't from the very top of the hill.

> o Less dependent on infrastructure (some repeaters are A/C only though)

And most aren't as hardened as cell sites. There are some amateur repeater
systems which use ruggedized commercial equipment and full emergency
power, but I'd wager they are fewer than cell sites which do.

> Weaknesses:
> o Can take longer to aquire frequency to use (repeater).
> o Autopatches are not generally "OPEN".
> o Requires licensed operators.

The latter is a major disadvantage because it reduces the number
of operators on the ground who are available for emergency operation.
For example, when an amateur today tries to report a traffic accident,
he'll usually find himself fifth or sixth behind cellular phone users who
have already called it in. Because there are so many more cellular users
than amateurs, the probability that one will be on the scene is much
higher. That's offset to some degree by the fact that the licensed
operators are often more knowledgeable and skilled, of course. But
no amount of training can substitute for being on the spot when needed.

>(Please add your own to the above). When TV arrived radio
>did not go away, but it did change. With cell phones here ham radio
>will probably not go away, but needs to change...progress like cell
>phones can be good. Me......I have both decided I like having both
>a cell phone and a ham radio !

Yeah, me too. I think cellular is primary for personal emergencies,
but it is a comfort to also have amateur gear on board. And besides,
I'm not limited to emergencies for use of the amateur gear. I can
also use it for fun. Cellular's per minute charges, and lack of the
waterhole effect of a repeater, make it less suitable for that.

Hi John,

Try to determine the AC Specs (either WATTS or VA volt amperes)if shown somewhere on the chassis.

Call Mouser Electronics 1-800-346-6873.

On page 252 of their current catalog are Isolation and autoformers at the bottom of the page. They are rated for both 50/60 cycle transformation.

Just reverse the primary to secondary for input and output.

Unless your radio draws excessive current you probably can get by with under $12.

For your application this may be the answer.

The ICOM W32A is a great unit for a low cost. You can pick one up for $300 from HRO and they pay shipping.

The W32A comes 5W out of the box. You cannot beat the BP-173 battery that is included. This rig has crossband repeat as well as other features.

If you want to know more about it, go to the ICOM America web page.

The Holmdel Amateur Radio club is selling its Kenwood TS-830S
and VFO-240 in order to upgrade our equipment. The equipment is
in excellent condition, and we are the original owners. It's resided
in our shack since we bought it new in the mid-1980s. The
TS-830S also has the optional CW filter installed.

I would like to sell this via a bid process. If you are
interested, please send you bids to me by Friday, Sept.
19. I prefer to sell both pieces as a set, but will
consider seperating them if necessary. All equipment
works perfectly, but we seem to have lost the original
manauls (still have a xerox copy).

Thanks,
For the Holmdel Amateur Radio Club,
Joe Levantino - KB2FSH

In a disaster situation, I'm guessing that the above phone's use would
be somewhat limited as it could get connected to the network, but I'm
guessing it would fare no better than regular cell phones in accessing
land phones within the disaster area for assistance. Am I correct? I
have no knowledge of the satellite or Irdium systems, but I am not
against learning.

One method that wont work for more than a fraction of a second is one I observed at a construction site.

I watched a Carpenter twist one of the flat blades on the plug of his Skill Saw to fit the only receptacle left on the temp service. I suggested he might not be happy with the results because of the wrong voltage. He more than suggested I could do something sexual with myself, as he had done this before without problems. In spite of the danger of him inviting me to participate in additional sexual adventures, I pointed out, the other times it might have been a 20a 120v receptacle, not a 240v receptacle.

To my surprise, and to the delight of the Carpenter, the saw was a lot noisier, but operated with more power. He made it through four 2 x 4's before it went up in smoke.

I was tempted to ask if it was still necessary to carry out the sexual maneuvers he suggested or if they would be unnecessary at this point.

Louis

Is this power into an antenna or dummy load? If into a dummy load, yes,
you have something wrong with the transceiver. If into an antenna, invest
in a SWR bridge and get your antenna match as close to 1:1 as possible as
the 130 will reduce power into a mismatched output.

Also, the 200 W PEP SSB is with a supply rated at 13.8VDC under load.

Hallo Brian,

The 232 is ok, but the PK88 modem is verry sensitive fore HF exited by your
TRX,.
I experiencted with my HAM CB tranciever that when power was up to 4 Watts
the audio signal caused by HF made the modem not to function as it should.
Other colleges had the same problem.
I even tried to place some ceramic condesators to shortcut the HF, this
dind't work as well.
So take the 232, but make shure there is a DCD in it, it will make work
things better, than working with a soft DCD as provided in the TFPCX driver.
Excuse my bad English.

>> Looking for opinions on which is the the best dual band HT and why.
>> Must be at least 4 watt.

Not saying this is the best, since it's the only one I've ever owned,
but here is my two cent's worth... I have a Yaesu FT-51R, and have
been fairly pleased with it. It is a 2m/70cm, 5W with a gazillion
bells and whistles, including cross-band repeat. It has all sorts of
features that I think I'd never use, such as paging.

Pluses:

It has very nice audio (clear, loud)
Is very compact
Several output power levels (20mW, .5, 1.5, 3, 5 W)
Alpha-Numeric display... maybe it's just me, but I really like
this feature, because I can store a short description of a
frequency, such as call sign or area of a repeater, name of
a satellite and whether it is up/down link, etc.
Seems like an excellent receiver

Minuses:

Non-standard AC adapter/charging. Look for this, maybe in
other Yaesus... I learned that most HT's have a little
phono-style plug, so it's simple to make your own power
cord. But on the FT51R at least, you have to buy a special
adapter which fits over the bottom of the battery, and then
you can't stand up the radio, because this thing is stuck
to the end. A major pain, if you ask me, and a BIG minus.

I personally like the 3-500 tubes because they are readily available
and still fairly cheap, and also are fairly rugged. However,
in general many of the amps that run a pair of them can't
make the "full legal limit" on all bands.
Typically a pair will do 1200 or 1300 watts output in something like
the Heath SB220.

From: sammy <Sammy89@hotmail.com>
Message-ID: <35F7C658.D317C36A@hotmail.com>
Source record: 132373

I got a price of $1300 from Two Dealers. I suspect the price will
eventually drop once the Icom IC-706 MK II "G" model (has 440 MHZ) comes
out to compete. Or more likely you will get the seperation cables free
after 4 months. I heard Alinco may have an
updated DX-70 update to compete with these two and ADI (Premier) is
coming out with
a $500 contender also. I heard it will be like the Kenwood TS-50 but for
$500.

Take Care, Sam

3918. TRIEX H470 TOWER 4 SALE

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-10 00:00:00 UTC
From: ilonka00@hotmail.com
Message-ID: <35f9d4af.117546502@netnews.worldnet.att.net>
Source record: 132375

TriEx H470 70' tower for sale.

This is a 4 section guyed tower,
including guy wires, turnbuckles,
equalizer plates, rotor plate
(drilled for Yaesu and HAM-M)
owner's manual, etc. The tower
recently lost a guy anchor and
was pulled over by the other guywires.
It is now on the ground, telescoped to
about 20', and is ready for pickup in the
Kansas City area. It weighs around 500#.
The tower needs a new base plate, and
the bottom section legs need to be straightened
or sleeved about 3' up from the base.
Other than this the tower is in good shape
and was recently painted. If you can weld,
this tower can easily be salvaged (I don't
have welding equipment or those skills). $250,
pickup only.

>have no knowledge of the satellite or Irdium systems, but I am not
>against learning.

It depends. There are several different satellite schemes. Some downlink
to an Earth station in the footprint and your call is routed from there, either
terrestrially, or back up to the satellite. If the terrestrial system is jammed,
you're still hosed. Some systems directly link from one satellite phone
to another (the switching is done in orbit, relayed satellite to satellite if
necessary). These will work regardless of what has happened to the
terrestrial network. However, they are subject to overloading as well if
enough satellite phone users in the footprint attempt to access them at
the same time.

Generally, the capacity of satellite systems is lower than the capacity
of terrestrial systems. That's unlikely to change for a number of years
because satellites are expensive, and the footprints are relatively huge
compared to the footprint of a terrestrial cell.

Iridium is pitched to international travelers. It is especially valuable
in areas where terrestrial phone service is sketchy or non-existent.
In densely populated areas, wide usage would quickly saturate the
footprint. Teledesic promises a very much higher capacity system
(voice and data). It may be competitive in capacity with terrestrial
cellular if it is fully deployed. It is a much more ambitious project,
however, and may not see full deployment (800 satellites versus
77 for Iridium).

The major benefit of satellite phone is for use in remote areas which
don't have much of a terrestrial phone infrastructure (such as the
example Hans gave). Whether there is a disaster or not, there won't
be a lot of competition for system resources in the footprint, so it is
unlikely that the system will become overloaded.

Systems which offer in orbit switching and routing are most immune
to terrestrial disasters. Since they don't have to depend on a terrestrial
switching center in the disaster area footprint, they can let you call
other satellite phone users in the area, or couple into the terrestrial

network remote from the disaster area.

Currently, satellite phones are from 3 to 6 times as expensive as terrestrial cellular phones, but that gap should narrow as a mass market develops for them. Half of the Iridium constellation is now in orbit, and the other half is scheduled to be up next year. So you should start to see a big push to sell Iridium phones.

Teledesic is further from operational status, with only two test satellites in orbit, but it is intended for a much larger mass market, so when it does become operational you can look for sharp and rapid price drops for the data sets and phone sets it will use. (Bill Gates intends for it to become *everyone's* internet connection.)

The current Imarsat system isn't actually cellular, but the price of phones for it have dropped by half in the last year (probably partly due to the imminent Iridium roll out, and partly due to custom chipsets which have lowered manufacturing cost). You can get a handheld phone for it today, with a built in GPS, for $1500. That's about what you'd pay for a midrange amateur HF transceiver.

The per minute usage charge is the killer, though. At $2 a minute, you aren't going to use it for casual calling. Iridium phones and usage charges will be cheaper, and Teledesic will be much cheaper, if they hold to their marketing plans. There will probably also be marketing promotions where they give you the phone for free if you sign a contract to use the system for a certain period of time, just as the terrestrial cellular companies do now.

As a backup communications resource in remote areas, Imarsat is price competitive with HF amateur radio today, and doesn't suffer from propagation anomalies or problems finding a suitable destination station. In the near future, the other systems coming on line will be price competitive with handheld VHF amateur equipment, and will offer the capacity to duplicate its functions as well. Teledesic will be basically immune to terrestrial disasters, and per minute charges will ultimately drop below one cent a minute if current marketing plans hold true. (And that's a flat rate globally, which won't make the current long distance carriers very happy.)

One of the things I have not seen mention is the types of communicating that cell service provides compared to amateur radio.

Cell service, like it's land line counter part, provides only point to point private communications. This is fine if you are calling in an accident that only involves the need for two people to communicate with each other. It is the best route to use for that type of situation.

On the other hand most disasters require many people in many locations to be able to communicate. The formal net provides this capability. There is just no way that cell service can provide this without elaborate conference bridges which may or may not be available in an emergency.

It is not only the equipment that amateur radio provides, but a trained communicator who knows how to get a message through under adverse conditions.

3934. FS: TS-440-S (AT) New price

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-10 00:00:00 UTC
From: "Wayne K. Irwin, W1KI" <w1ki@arrl.org>
Message-ID: <35F7F6C2.38D5@arrl.org>
Source record: 132391

For Sale:

Kenwood TS-440-S with built in antenna tuner

Comes with the following:

Optional 250 Hz CW filter (installed)

Optional 1.8 kHz SSB filter (installed)

Mobile mounting bracket (only used mobile a couple times)

Slow VFO tuning mod by International Radio and Computers Inc./Fox Tango (complete documentation included.)

Original shipping carton, microphone and manual.

Asking $650.00 (offers considered) (shipping negotiable) (non-smoking environment)

Contact Wayne, W1KI at the following:

w1ki@arrl.org

3935. FS Kenwood TS-820S Station

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-10 00:00:00 UTC
From: Gary Hawkins <gary@flightplan.com>
Message-ID: <6t8ubd$e3i$1@supernews.com>
Source record: 132392

I have an exceptional Kenwood TS820S station for sale. The radio looks and works perfectly, has the digital readout and the optional CW filter. Accessories include the matching speaker with the optional filters installed, the Kenwood antenna tuner, and the external second VFO. I also have the MC50 matching microphone, all manuals and original boxes and a copy of the radio service manual. Pictures available on request.

$500 and I will have it shipped professionally (double boxed) from Wisconsin anywhere in the lower 48 states (my estimated shipping cost is $110).

You can try my FT-50 modification FAQ. It'll explain how to freeband older ft-50's and how to set the newer ones to canadian mode (out of band rx without out of band tx) to at least allow cell RX. The faq needs to be updated with some new info, and I'll be doing that within the next week, but it's still a good place to find out how to open up your ft-50's capabilities.

>understand what you are trying to say here.

What I'm saying is that the number of simultaneous users a given AMPS cell can support *is* a small fixed number. It is more than 6, however, my hazy memory of the AMPS system was wrong about that. I went back to the books and found that there are 19 channels plus a control channel per basic cell. Sectored cells have 3 times that many. And there are some tricks being used to squeeze in a few more than that in some cases. But it is a fixed number per cell. When all the channels are busy, that's it, no more capacity is available until someone hangs up.

> CDMA digital cellular avoids this problem and can have as many calls

>maybe a factor of two improvement for standard usage, not anywhere
>near unlimited capacity.

My statement contained a bit of hyperbole, but there is no *fixed* limit to the number of users in a CDMA cell. As the SNR for all users degrades with additional loading, there comes a point where calls start being dropped, but that point depends on a number of variables and can't be assigned a fixed value per cell. Usually, in practical systems, the trunk capacity of the

cell is the limiting factor rather than the information capacity of the shared radio channel.

It should be obvious that AMPS uses the available spectrum very inefficiently. TDMA uses it somewhat more efficiently, and CDMA uses it most efficiently given the statistical nature of phone usage. The question of whether to use TDMA or CDMA boils down to whether you want a fixed capacity at a given guaranteed SNR, or whether you want a considerably larger capacity with a gracefully degrading SNR. That boils down to a marketing decision.

> or as there is trunk capacity from the cell site to the central
> switching point.

>bandwidth you have available between the fixed instalations and
>between the mobile and the fixed installation, and the bandwidth
>between the mobile and the fixed installation is likely going to be the
>limiting factor in practice.

Perhaps surprisingly, it isn't. The economics of the phone system dictates where the limiting factor will be. Trunk capacity is sized according to a statistical traffic analysis table to be about 10% to 30% of the total capacity from the end user to the first subscriber concentrator frame for the wired network (depending on the type of users, IE business districts are sized for greater trunk capacity per subscriber line than residential districts). For AMPS, there is a one to one mapping of supported channels to trunk capacity because the AMPS radio links are the limiting economic factor. For TDMA the same is true. But for CDMA you're starting to get into a situation like that in the wired local loop, and trunk capacity starts to be the limiting economic factor.

> So as cellular systems convert to digital, and as microwave or

>any incentives to put into place control systems to manage bandwidth
>in emergencies.

Actually, they have a *very* strong incentive to maximize up time. That's *revenue*. A cell site which is down is generating no revenue. So it is to

the advantage of the cellular company to take rather strong steps to keep the system up time as large as possible. The cellular providers here have battery backup and auto start generators for their cell sites for this reason. And their towers and antennas are engineered to withstand environmental extremes, which in this area are primarily lightning hazard from our frequent thunderstorms, wind damage from the same, and somewhat infrequent but very severe and widespread ice storm loading of antenna structures.

Control systems to manage bandwidth, IE prioritized numbers, are in place because our PSC demanded that it be in place in time for the Atlanta Olympics, and allowed a surcharge to cover it in the tariffs. Some of our public safety agencies have switched to cellular rather than upgrading their two way systems. And relatively large numbers of commercial enterprises have as well (the system supports multiple priority levels). For example, the company for which I work has almost totally switched to cellular for communications with our news crews. We only keep our two way system operating because use of cellular from a helicopter is illegal. The coverage and up time of the cellular systems has far surpassed what our up to date and commercially installed and maintained two way system could provide, and at a lower cost too (free actually, since we do it as a cross promotion trade out with the cellular provider). It also offers a degree of comm security so our competitors can't easily eavesdrop and pick up on our exclusives.

>Cellular systems also don't have the coverage needed for emergency use
>(or, for that matter, most rural uses). Areawise, even most of the SF
>Bay Area isn't covered. I'm moving, and my new house, within 20

>of cellular systems even in urban areas is so poor (and costs are so
>high) that most commercial users (taxicabs, pizza delivery,
>contractors, etc.) use their on mobile radios instead. And there is
>no coverage in many rural areas at all.

That certainly isn't the case here, or in most other areas where I've traveled. Within a 50 mile radius of Atlanta, you'd have to work very hard to find a spot without cellular coverage from one or both of the primary cellular providers. Even at my farm in rural Kentucky, there is solid cellular coverage. We frequently lose power and wired phone service up there, but to date cellular has not failed, even during severe storms.

Perhaps your coverage issues have more to do with the regulatory environment of your area than they do with economics or technical factors. We haven't faced the extreme activist pressure against cell towers here that I've heard occurs in some other areas. And our PSC is very hot on demanding that providers establish universal coverage in their authorized service areas. Cell sites have sprouted like weeds. There are 3 within sight of my house here in the suburbs. I can see 8 from the yard of the farmhouse up in Kentucky, though I'll admit that's on the second highest point in the county up there.

>Commercial cellular systems are completely inadequate for emergency
>use. The amateur radio service, on the other hand, uses robust

>infrastructure that provide exceptionally wide coverage and continue
>to work even in emergency situation.

Well, perhaps in *your* area the amateur infrastructure is robust. But that certainly isn't the case everywhere. Few of our repeaters have emergency power, fewer are robustly engineered to withstand the environmental stresses placed on them by our weather, and only a few provide wide coverage. There are a few properly designed and implemented amateur repeaters here, but only a few (and one of those, mine, lost its preferred high site when we re-engineered our broadcast tower for DTV). There are a couple of linked systems, and a few more with voters (our GARS system is one of them), but in general coverage is spotty. Downtime is also common. There are no crews on 24 hour call to restore service when an amateur repeater goes down. Even without an emergency, a system may be down for up to a week before someone is able to get up to the site and fix it. Etc.

Of course our simplex resource is fairly robust due to the fact that so many of us have equipment capable of doing emergency power simplex, which the cellular user can't do. However, we are still thin on the ground, and the average amateur's simplex range is quite short due to our rolling terrain. So we can't take much advantage of it for anything but purely local neighborhood communications. We need the repeaters for anything requiring wider coverage, and they are few and mostly vulnerable.

>The users are trained and
>licensed and participate in regular exercises.

We have ARES, and participate in SET, but only a relative few of us do. Probably only a couple hundred out of the approximately 4,000 amateurs in the metro area regularly participate in emergency drills. More cellular users than that dial 911 every hour. We're licensed, and some of us are even knowledgeable, but we don't have the resources of the maintenance departments of the cellular providers. (In that context, it is fortunate that we have so few repeaters to maintain, otherwise those of us who are knowledgeable would be overwhelmed.)

>And there are rules
>and procedures for sharing and prioritizing bandwidth.

??? Aside from infrequent FCC declarations, I am unfamiliar with any such rules or procedures. Our basic rules require us to give priority to emergency traffic, but there is no formal mechanism for assigning or prioritizing spectrum resources for that.

>Many of these
>factors depend on the fact that amateur radio is not a consumer
>product, and any consumer based service will have trouble replicating
>these features. Of course, adopting cellular and spread spectrum

>technologies in the amateur service could help improve its capabilities
>for emergency use, and that is something we should be looking at
>in the medium and long term.

Cellular techniques are probably beyond our grasp. The economics
associated with maintaining so many sites is beyond us. We're thin
on the ground, so we're pretty much stuck with wide area relay systems
for the foreseeable future. If our numbers were much greater, that could
change of course.

SS may be beneficial, but probably not, due to the very high RF environments
of the suitable high relay sites we have to use. That's because every other
radio service is forced to use them too, and the RF levels on those few
suitable sites are *intense*. Without tight cavity filters, receivers can't live
on them, and of course SS receivers must be wide open, so they go crunch
on these sites (that problem may be solvable, but we haven't been able to
do it to date). And recall that because we are thin on the ground, we *need*
these high sites to achieve connectivity.

>With some effort, satellite phones might become more useful for
>emergency use, but I see no efforts in that direction, and I don't see
>any of the necessary infrastructure being put into place.

Half of the Iridium constellation is in orbit, the other half will be in
place next year. And Teledesic, with the backing of Gates and
McCaw, is in the process of lofting an 800 satellite system with
the express purpose of being able to replace the wired internet,
as well as providing global satellite cellular capability, for *everyone*.
Their vision may exceed their grasp, but I wouldn't count on it.
They'll certainly deliver a capability far beyond what we can do
as amateurs.

I seem to be saying that there's no place left for amateur radio
in emergencies. That isn't true. There is still a place for us, but
it isn't the grandiose place of central importance that some
seem to believe. We are auxiliaries, and pretty thin on the
ground auxiliaries at that. We can fill in some of the gaps, but
we aren't up to the task of shouldering the main load.

3948. First HF Radio

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-10 00:00:00 UTC
From: brianj@televar.com
Message-ID: <6t97ce$kv2$1@nnrp1.dejanews.com>
Source record: 132405

Several years ago I moved away from a club that had a shack members could use. Now I am finally getting to where I can afford to purchase an inexpensive HF radio.

My question is which would the group recommend? After doing a web search it seems the two best recommended bottom-of-the-line radios are the Alinco DX-70T and the Kenwood TS-50S. However, after doing a search I haven't seen recent reviews of these radios.

Anybody having an opinion on one of these radios, or another radio in their price class (under $850US) please reply.

73,
Brian / KB7OIE

I was using a mobile 706 outfit on vacation in Spain this year. I left
the car out in the sun and when I came out to the car a couple of
hours later it was 62C inside. A helical antenna had just about melted
and was a useless blob ,but the 706 fired up with no problem and
worked with a Hustler on full power....

You are correct in regard to HRO which has an EMS-11 for around $50.
However, I've seen several compatible new mikes at swap meets for
around $30.

The SG-2020 is an improved, re-packaged Index Labs QRP rig. As a seasoned
QRPer, I would NOT recommend a QRP rig for a beginner (the SG-2020 has a
20 Watt PA, I believe). Spend your $600 on a good used HF rig, perhaps a
Kenwood TS-430S/TS-530S/TS-830S, Ten-Tec Corsair I or II, Icom 735/751,
or something similar. The SG-2020 looks like a super QRP rig, and I may
buy one myself at some future time.

All the stuff on this thread is nothing, when set against the need for hams because the phone system, cell phones included, STILL clogs up when disaster strikes. So the need for hams is still here. Read the ARRL Journal (QST mag) section on this. They have only what is reported to them, too.

It may be that we are only now seeing how BAD the overloads were back in the good ole days. Or maybe we still ain't seen it all.

In Oklahoma City, after the Murragh Blast, the authorities asked civilians to stay off the cell phone systems if they could, and they still used over a hundred hams at a time, as it was told to me. Where I sat waiting to go out, there were 30-40 other hams waiting too. There were 3 or 4 locations, I believe.

We still couldn't do enough. There was a lot of depression over that one. There always is. I don't expect it to let up any time soon.

"I don't know a good definition for insanity, and I don't know anyone who does.
"Even the shrinks can't agree, so they dont know either.
"BUT, I can give a damn' good example:
"That is when the authorities call the TV stations and say there is something
"very bad coming, get in shelter, don't stop to turn off the TV, GO NOW !
"An hour or 6 earlier, they called a buncha hams and said
"Will you go sit on a hilltop?
"AND WE GO!
"At our own expense.
"LOOKING FOR SOMETHING WE HOPE WE DON'T FIND!
"If we did find it we couldn't eat it. Or stuff it and hang it on the mantel.
"Like a young storm chaser said to an old one,
"What do you do if you catch one?

"The old man answered,
"Throw it back. It's too small."

From the looks of the SGC 2020, it seems to have a WONDERFUL receiver and they seem to be real conscious about phase noise concerns, birdies, etc. I sometimes think the triple-conversion route is too fraught with complexity to offer really superior recieve performance.
Some radios are so small and so computerized that I doubt adequate shielding is present to keep the birdies out and the noise floor low.

I really *DO* wish SGC would offer a 100-150 watt non-QRP version of the '2020 in a slightly larger case with a few more controls easily available - instead of multple menu items and button combinations. Then I'd buy it in a snap.... but then that might compete against SGC's flagship 2000 commercial/ham unit..... but I'd rather have such a radio than any miniature like a Kenwood TS50 or Icom 706.

Of course you could also add SGC's 500 W amplifier module and auto tuner units for a real setup....

Dean's suggestions for used rigs are right-on; for a reasonably-priced/performing *new* HF rig, you might consider the Yaesu FT-840. Good solid performer, often available new for around $720+ to $800 (depends on phase of moon, etc :-)

Joe,

To store a memory, you need to hold the M.IN key and the desired
memory number (0 - 9) at the same time.

If the clock keeps time with the radio unplugged, the backup battery
is ok. I have had my 940 since 1984 and the batteries (there are 3)
were still good when I sent the radio in for service last March. I had
them replace the batteries while they were in there.

Gheil Electronics @ 513 683-2676. He provides a chip modification that
moves the memory bank select function from the top panel.

3963. RX Antenna Fuse IC-756

Source record: 132420

A friend of mine has apparently blown a fuse in the RX antenna input of his Icom 756. He admits to running his receive antenna too close to the transmit antenna (running a KW).

The fuse in question is between the T/R relay and the RX antenna connector and appears to be an small incadescent bulb.

The problem is that this does not show up on either of two versions of the appropriate schematic and he can't obtain a part number for this fuse / bulb.

3965. HELP: Engine Noise in HF Mobile Installation

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-10 00:00:00 UTC
From: tony@bright.net
Message-ID: <6t9eiuhac1@cletus.bright.net>
Source record: 132422

I'm in the process of installing a Yaesu FT-900 in my 1987 Ford Thunderbird. I am experiencing noise on the Ford's AM radio and on a shortwave portable I used for noise testing, so I expect to encounter the same when I have the HF installation completed.

So far, I have changed out the spark plugs wires, the distributor cap and rotor, and have used copper strap to bond the trunk, doors, and hood to the chassis. These measures have helped, but I still experience noise on the AM band.

The Yaesu will be trunk-mounted, with the power leads routed through the firewall grommet, under the door molding, and behind the rear seat to get to the trunk. My HF antennas (Hamsticks) will be mounted on the trunk lid, with a very short coax run.

Those are the particulars. Can anyone offer advise as to how to remove the remaining ignition noise? I have heard that the Ford electronic fuel pump also can be the cause of interference; has anyone had experience in fixing this problem?

Thanks for any advise offered.

73,

Tony N8SNC

The ref# for the part you are talking about is DS-1
and the part # 5080000370
Description is
Lamp HRS-4160A

>The problem is that this does not show up on either of two versions of
>the appropriate schematic and he can't obtain a part number for this
>fuse / bulb.

This is from the service manual!

Good luck

I have read that some dealers already have the ft-100, I will like to know if there is a dealer in the web who sells it and for what price.
I will also like to know if somebody knows if the ft-100 is capable of cross band repeat in the 2m and 70cm bands and if that rig can be moded to TX out of the ham bands.(I guess that this question is "always" yes)

Not on the HTX-404. However, it can be changed on the HTX-202 by
turning the autoreply (ar in menu) ON. The only downside to this
is it requires PTT to be held when entering DTMF; then the tx drops
immediately upon release of PTT.

Don K6LTS
donrm@sr.hp.com

DTMF - STOPPING LONG Turn autoreply (ar in menu) ON. This requires the PTT
TX HANGTIME- to be held when entering DTMF; tx drops immediately up-
on release of PTT.

3974. SATELLITE SOFTWARE - HOW IT CAN HELP YOU!

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-10 00:00:00 UTC
From: emanuel.marques@NOSPAMmail.telepac.pt
Message-ID: <35f84ea5.29376086@news.telepac.pt>
Source record: 132431
Cross-posted to: rec.video.satellite.misc,rec.radio.amateur.space,rec.radio.amateur.misc,rec.radio.amateur.equipment

Many people don't know that the right software program can be of great help, even for the non professional dish installer (DIY). Others are reluctant to use satellite software because they think it's too complicated to use or even useless.

This is not a FAQ about satellite software, but an attempt on my part to try to better inform potential users about the benefices of using satellite software.

I. WHAT IS SATELLITE SOFTWARE?

II. ABOUT SKYSOFT SOFTWARE.

III. IS IT USEFUL FOR ME?
A) I AM A PROFESSIONAL DISH INSTALLER.
B) I AM NOT A PROFESSIONAL.

IV. SKYSOFT SOFTWARE AND OTHERS

I. WHAT IS SATELLITE SOFTWARE?

There are several types of "satellite television software". Some are dedicated to help professionals and DIY dish installers to setup satellite systems. Others are meant to emulate viewing cards used by encrypted channels. Another more recent type of software is meant to replace the original software of some satellite receivers in order to add new features.

II. ABOUT SKYSOFT SOFTWARE.
Skysoft is the name of my project dedicated to satellite software tools. I am only interested and dedicated to developing engineering software (dish aiming , downlink budget, etc.).
Currently I have three software programs available; EASYSAT, PCSAT, and ARQSAT.

You can find more information about Skysoft and the software at:
http://www.sat-net.com/skysoft/

III. IS IT USEFUL FOR ME?
A) I AM A PROFESSIONAL DISH INSTALLER.
The true professional plans receptions systems. It is hard to imagine someone doing all the required calculations one by one. Nor is it acceptable to use the trial an error method or go by the word of mouth to determine minimum dish size, for example.
A good software program can save you time and money!

B) I AM NOT A PROFESSIONAL.
If you are planning to buy a satellite system EASYSAT (just 25 USD!) can be a great help:
- Find what satellites you will be able to aim to.
- Find what satellites/channels you will be able to receive.
- Find the optimum dish size for your location and for the channels you want to receive.
- Help you better understand how satellite television reception works, and how individual components and parameters affect system performance.

If you already have a satellite dish system:
- Help you diagnose reception problems (satellite signal is too weak, dish is to small, deficient dish aiming, etc.)
- Help you decide on equipment upgrades (how much bigger the dish should be, will a lower noise Lnb "do it", etc.)
- Help you better understand how satellite television reception works, and how individual components and parameters affect system performance.

IV. SKYSOFT SOFTWARE AND OTHER SOFTWARE PROGRAMS.
There are other software programs that perform similar tasks, in what ways are EASYSAT and PCSAT different?

Being a long time user of satellite software myself, I have found that available satellite software falls into two categories:

1) Programs with many functions, but unfriendly and too technical for most users.

2) Programs easy to use, but with few features, "over simplified", and easily outdated. These are usually free programs sponsored by satellite equipment manufacturers and therefor are designed to work with only a particular brand of equipment (dishes).

Having practical knowledge of satellite systems design and installation. I have been integrating really useful functions and features to my software programs. Some of them are exclusive of my software, which makes them arguably the most user friendly and useful software for the typical professional and DIY installer.

For more details, please go to the Skysoft Web Site at http://www.sat-net.com/skysoft/

Kenwood TM-V7A Dual-Band Mobile Rig, With VS-3 Voice Syntesizer. Complete with box, manual, wires, etc....the radio also has been modified for full coverage(transmit+receive). In PERFECT condition and literally has less than 5 hours of use. Was a Christmas present and has been collecting dust in it's box since I initially used it.

I have a Astron RS-20A 120v 20amp Power supply to go with above, or anything else. Been used less than 5 hours also.

I also have a Comet GP-3 144/440 Dual Band Base station antenna which I have used twice.

I would prefer to sell as a package but will sell them separate. Asking price for all together is $600.

Please e-mail me and make an offer, or for any questions. I need to sell these items for my other hobby.

Thank you,

CJ <clagos@midnights.net>

I would look seriously at used gear as well. These things depreciate
pretty quickly; you can get a lot more for your money by going
second-hand. Anything in the Icom or Kenwood line will be just fine -
just get the best that fits your budget. (Ten-Tec makes some great
radios too, but their owners never seem to want to part with them!)

Tony... there is a tech note, recently issued by Ford, that deals with fuel pump noise in mobile radios. It requires putting a filter on the pump, which on my Explorer is inside the fuel tank. There were a whole range of cars, going back five or more years, that were cited in the tech. note.

You can recognize this noise by turning the radio on, then turning the ignition switch from "off" into the "on" position, but not all the way to "start." The fuel pump will run for one second, then shut off. In my case, the noise level jumps to about S7 or 8, which is where it will stay, of course, when the engine is running and the pump is on all the time. Try it. If you hear the noise, talk to Ford about the filter.

My explorer is a '74 and they're ordering the filter for me, covered by my extended warranty.

Good luck... Ed

Brian
You didn't say if you looked at the QST reviews.
The Alinco is in Dec 95
The Kenwood Sep 93
I have no experience with either-
However, seems to me they are both 12 volt units with a focus on mobile
application. Suggest you strongly consider the TS830S-well within your
price
range and a super radio. Seems that I've seen a flood of those one the
used
market lately. That's not an indication they are no good. People are
curious
about the latest-and-greatest.

Randy
How long have you been looking? Reason is I see requests
for that unit on occasion and keep an eye on the demand.
I have (4) but they are defective in some way. Will be
some time before I get to working on them.
There was a real problem in the mfg of those units. All
were wave soldered and were designed with through holes
top to bottom. Takes a lot of bench time to fix the
approximately 88 holes!

If you find one would be curious about the price. May be
dropping as the older kenwoods die out. There is a service
bulletin at the KW ftp site if youre handy at that sort
of thing.

Subject: Did the Hams just lose 10 meters?
Exactly. Solid copy to a JX yesterday evening at 28.010 with 35 watts
using a 22 year old rig, a 1/4 wave ground plane and practically no
filter to speak of. If y'all don't want to bother with 10 meters
because of QRM, I'll be happy to have the extra clear space. The band
is far more usable and QRM far less obnoxious than 20 meters with it's
100,000 watt California and PR flamethrowers blazing away at 500 wpm
and overloading the front end of this rig to the point where I can't
hear my neighbor. 10 meters rocks.

From: sepsteinx857@my-dejanews.com
Subject: POOR RESPONSE
Alinco is known for poor response. According to a former employee,the
reason
for one is that their U.S.branch manager is not a resident and rarely
visits
the branch. The person who claims to be the manager is actually the
"assistant" manager, more like a messenger. This explains why they have
poor
excuses for, from my point of view, half decent marketing policies. From my
speculation, I would expect the DJ-C1T (card radio mono band), DX-77(the
lowest HF and highest CB radio), and possibly VHF and dual band mobile
radios
will be on special sale from a mail-order discount store starting probably
October; this will outdo the existing dealers, but Alinco doesn't seem to
care about the past relationship with old dealers, and therefore, the old
users, who paid higher prices. Good thing, if any, is the DJ-X10T can
receive
blocked cellular band by reprogramming. Now you don't get this from Icom.
Sid

Subject: Want to make money fast?
Get 6 separate pieces of paper and write the following on each piece of
paper:
PLEASE ADD ME TO YOUR MAILING LIST.

$1 US DOLLAR PROCESSING FEE IN ENCLOSED.
PLEASE WRITE YOUR NAME, ADDRESS, CITY, STATE, ZIP ON THE PAPER.
(THIS IS KEY. THIS IS WHAT MAKES IT LEGAL SINCE YOU ARE PAYING FOR AND LATER OFFERING A SERVICE).
Now get six $1.00 bills and place ONE inside EACH of the 6 pieces of paper
so the bill will not be seen through the envelope to prevent theft/robbery
(Using colored paper will help hide the dollar bill). Then, place one paper
in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase and a U.S.
$1.00 bill. Mail the 6 envelopes to the following addresses:

#1 George Powel
15582 Grape Creek Road
Danville, IL 61834
#2 Brad Wright
16363 N 300 W
Covington, IN 47932
#3 Max Farr
2720 B 1/4
Grand Junction, CO 81503
#4 Anthony Marcus
32 N Macquesten Pkwy
Mount Vernon NY
#5 I.M.O.
1966 Tice Valley Blvd. #502
Walnut Creek, CA 94595
#6 Tim Keller
3231 Betsy Ln.
Herndon, VA 20171
USA
STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list. (If you want to remain anonymous, put a nickname, but the
address MUST be correct. It, of course, MUST contain your country, state/district/area,zip code, etc!!! You wouldn't want your money to fly away, would you?!?!).
STEP 3: Now post your amended article to at least 200 newsgroups. Remember,
200 postings is just a guideline. The more you post, the more money you make!
NOTE: IN MANY NEWSGROUPS THERE ARE PEOPLE THAT DELETE THIS KIND OF MESSAGES
I RECOMMEND YOU TO POST 1 OR EVEN 2 TIMES A WEEK TO 300 NEWSGROUPS SO OTHER
PEOPLE CAN SEE YOUR MESSAGES. THIS IS A WAY TO INCREASE THE

POSSIBILITIES
TO GET MORE MONEY!!
Don't know HOW to post in the news groups? Well do exactly the
following:
HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:
The fastest way to post a newsletter:
Highlight and COPY(Ctrl-C) the text of this posted message and
PASTE(Ctrl-V)it into a plain text editor (as Wordpad, Scrapbook, even
AOL's mail)
and save it. After you have made the necessary changes that are stated
above,
simply COPY(Ctrl-C) and PASTE(Ctrl-V) the text into the message
composition
window, after selecting a newsgroup, and post it! (Or you can attach the
file, without writing anything to the message window.)
If you have Netscape Navigator 3.0 do the following:
1. Click on any newsgroup like normal, then click on 'TO NEWS'. This
will
bring up a box to type a message in.
2. Leave the newsgroup box like it is, change the subject box to
something
flashy, something to catch the eye, as "$$$ NEED CASH $$$?!!", "READ
HERE!$!$!$" or "$$$!!!MAKE FAST CASH!!!$$$". Or use your own subject
title.
3. Now click on 'ATTACHMENTS'. Then click on 'ATTACH FILE'. Find your
file
on your Hard Disk (the one you saved from the text editor). Once you
find
it, click on it and then click 'OPEN' and 'OK'. You should now see your
file name in the attachments box.
4. Now click on 'SEND'/'POST'. You see? Now you just have 199 to
go!!! (Don't worry, it's easy and quick once you get used to it.)
NOTE: All the versions of Netscape Navigator's are similar to each
other, so you'll have no problem doing this if you don't have Netscape
Navigator 3.0.
(FOR A QUICK TIP)! Netscape Navigator 3.x and above)
You can post this message to many newsgroups at a time, by simply
selecting
a newsgroup near the top of the screen, hold down the SHIFT, and then
select a newsgroup near the bottom of the screen. All of the newsgroups
in/between will be selected. After that, you follow/do the basic steps,
stated below
in this letter, except step #1. You can go to the page stated below in
this
letter and click on a newsgroup to open up the newsgroups window. Once
you've done this, in the same window go to 'OPTIONS', and then mark
'SHOW ALL NEWSGROUPS' and 'SHOW ALL MESSAGES'.
Now you can see all the newsgroups and you can apply easier the above
tip.

==========
Now the WHY part:
==========
Out of 200 postings, say I receive only 5 replies (a very low example). I
made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who
just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5
and only 5 persons respond to each of the original 5, that is another
$25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and
only 5 replies each, I will bring in an additional $125.00! Now, those 125
persons turn around and post the MINIMUM 200 with my name at #3 and only
receive 5 replies each, I will make an additional $626.00! OK, now here is
the fun part, each of those 625 persons post a MINIMUM 200 letters with my
name at #2 and they each only receive 5 replies, that just made me
$3,125.00!!! Those 3,125 persons will all deliver this message to 200
newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react I will receive $15,625,00! With a original investment of only
$6.00!
AMAZING! And as I said 5 responses is actually VERY LOW! Average is
probably 20 to 30! So lets put those figures at just 15 responses per
person.
Here is that you will make:
at #6 $15.00
at #5 $225.00
at #4 $3,375.00
at #3 $50,625.00
at #2 $759,375.00
at #1 $11,390,625.00
When your name is no longer on the list, you just take the latest posting
in the newsgroups, and send out another $6.00 to names on the list, putting
your name at number 6 again. And start posting again. The thing to remember
is, do you realise that thousands of people all over the world are joining
the internet and reading these articles everyday, JUST LIKE YOU are now!!
So can you afford $6.00 and see if it really works?? I think so... People
have said, "what if the plan is played out and no one sends you the money? So
what! What are the chances of that happening when there are tons of new
honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Estimates are at

20,000 to 50,000 new users, every day, with thousands of those joining the
actual internet.
**REMEMBER, everyone needs to keep a record of who's playing
and who's being honest.**
** By the way, if you try to deceive people by posting the messages with
your name in the list and not sending the money to the rest of the people
already on the list, you will NOT get as much. Someone I talked to knew
someone who did that and he only made about $150.00, and that's after seven
or eight weeks! Then he sent the 6 $1.00 bills, people added him to their
lists, and in 4-5 weeks he had over $10k.
This is the fairest and most honest way I have ever seen to share the
wealth of the world without costing anything but our time!!! You also may
want to buy mailing and e-mail lists for future dollars.
Make sure you print this article out RIGHT NOW! Also, try to keep a list of
everyone that sends you money and always keep an eye on the newsgroups to
make sure everyone is playing fairly. Remember, HONESTY IS THE BEST
POLICY.
You don't need to cheat the basic idea to make the money!!
GOOD LUCK to all and please play fairly and reap the huge rewards from
this, which is tons of extra CASH.
Please remember to declare your extra income. Thanks once again...
==========
LEGAL ? ? ? (Comments from Bob Novak who started this new version.)
"People
have asked me if this is really legal. Well, it is! You are using the
Internet to advertise your business. What is that business? You are
assembling a mailing list of people who are interested in home based
computer and online business and methods of generating income at home.
Remember, people send you a small fee to be added to your mailing list.It
is legal. what will you do with your list of thousands of names? That's up
to you."
So, build your mailing list, keep good accounts, declare the income and pay
your taxes. By doing this you prove your business intentions. Keep an eye
on the newsgroups and when the cash has stopped coming (that means your
name is no longer on the list), you just take the latest posting at the
newsgroups, send another $6.00 to the names stated on the list, make your corrections
(put your name at #6) and start posting again.
==========

NOTES:
*1. In some countries, the export of the country's exchange is illegal.
But
you can get the license to do this from the post office, explaining the
above statements (that you have an online business, etc. You may have to
pay an extra tax, but that's OK, the amount of the incoming money is
HUGE!
And as I said, a few countries have that restriction.
*2. You may want to buy mailing and e-mail lists for future dollars. (Or
Database or Spreadsheet software.)
*3. If you're really not sure or still think this can't be for real,
please
print a copy of this article and pass it along to someone who really
needs
the money, and see what happens.
*4. You will start getting responses within 1-2 weeks, it depends.

3999. MFJ mobile antenna any good?

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-10 00:00:00 UTC
From: dave@antispam.lansol.com
Message-ID: <35f8647b.19171987@news.ncal.verio.com>
Source record: 132456
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I'm considering the MFJ 1724 or 1729 antenna. The 1729 is a bit long, but I am concern that the 1724 offers very low performance. Anyone experience with these MFJ antennas?

Any question I have is that MFJ antenna's seems to be much lower than Comet, Diamond ante ann's. Are these low prices reflect their quality?

Any advice would be appreciated.

=-=-=-=-=-=-=- Listing for Amateur + CB + Scanner =-=-=-=-=-=-=-

Amateur Mobile:

HTX-242 Mobile Radio
- 136-174 MHz VHF 45W 2m receiver. Extend TX by
buttons.
- Purchased: March 1997
- Warranty: ~1.5 years RS extended warranty
- Asking: $160 CDN or $100 US + shipping(radio shack
price $399.99 CDN + tax). It's about 65-70% off the regular
purchase price (if you include the tax as well)
- Box + Manual + Proof of Purchase
- Note: This radio is cigarette lighter plug ready.
You do not need to attach a cigarette lighter plug. It's already
there. Working perfect. Low usage to now.

Power Supply (Techcessories)
- 6A max Power Supply. Works perfect for HTX-242
mobile. Want to use for HTX-202 ? I will give you a plug free !!*
- Purchased: March 1997
- Warranty:~1.5 years RS extended warranty
- Asking: $40 CDN (radio shack price 99.99 CDN + tax)
or $25 US + shipping
- One output and one cigarette lighter plug output
- Box + Manual + Proof of Purchase

RS Mobile Antenna
- Purchased: a year ago. i have two.
- Warranty: no
- Asking: $5 CDN (Original Price well exceeded $60
CDN)

All* of this [amateur gears] for... $200 CDN or $130 US FUNDS
I prefer sell all of these at once. Need an extra mobile
rig or start ham radio and looking for one ? This is a good
opportunity for you to add an extra rig !! 1st come (payment), 1st
serve.

==========
Amateur Portable:

HTX-202 SOLD at $99 CDN. No Longer Available !!
Thank you for your correspondance.

CBs:
TRC-484
- 40CH AM Mobile.
- Purchased: April 1997
- Warranty:~1.5 years RS extended warranty
- Asking: $60 CDN or $40 US (radio shack price $139.99
CDN + tax)
- Cigarette plug alREADY !!!!!
- Portable CB ANTENNA comes with this !!!!!
- Power can be modified up to ~8-15W (it is illegal.
do this at your own risk)
- Box + Manual + Proof of Purchase

TRC-485 looking for SSB CB for low cost ?
- 40CH AM, 80CH SSB
- Purchased: December 1997
- Warranty: 6 months RS warranty
- Asking: $130 CDN or $90 US (radio shack price
$299.99 CDN + tax)
- Cigarette plug alREADY !!!!!
- Mobile cellular look like ANTENNA comes with this
!!!!!
- Power can be modified up to ~8-15W (it is illegal.
do this at your own risk)
- Box + Manual + Proof of Purchase

I will try to attach antenna for all the CB rigs free.

Scanners:

Pro-28 Portable Scanner
- General VHF and UHF scanner
- Purchased: August 1997
- Asking: $59 CDN or $39 US (radio shack price $129.99
CDN + tax)
- Rechargeble Alkaline Batteries or Ni-Cads included.

- Box + Manual + Proof of Purchase

Accesories:

Micronta SWR/POWER Tester
- SWR/POWER Tester for HF
- Purchased in 1997
- $25 CDN or $15 US (radioshack price $44.99 CDN +
tax)
- ~2.5 years instant exchange extended warranty (i.e.
you buy this and if there is a problem, you can exchange it anyway...
although working perfect at this time)
- Manual + Proof of Purchase

=-

1st come, 1st serve.

Why selling: I am trying to clear up my stations... I am very busy
nowadays and do not have time for ham or CB...

ALL PRICES ARE NEGOTIABLE !!!!!!

Enjoy !!

>most sites are sectored today.)
>
Most of the above is grossly inaccurate. An AMPS cell site can handle
many more simultaneous calls than 6. Each channel set has 15 standard
voice channels, 4 to 5 extended voice channels and one control
channel. There are 42 channel sets with half assigned to the wireline
carriers and the other half assigned to non-wireline carriers. A call
is set up on one channel not two. A cell can have as many voice
channel radios as frequencies are available. In several areas we
have sites with as many as 30 voice channels per sector (120 degree
sectors) which make the cell capable of 90 simultaneous calls.

It seems that Gary has a fairly good handle on the digital end of the
cellular world but he needs to bone up on his AMPS theory.

When moving from cell to another the most common causes of dropped
hand off is interference and fade. If the cell you are approaching is
too busy to accept your handoff the switch (the brain of the cellular
system) will look for another nearby cell to send your call to. This
is called directed retry. You will hand off to that cell and stay
there until there is an available channel (usually not too long) on
the cell you are closest to.

I agree. It is very unlikely the control channel could be overloaded.
But it is possible. And there are bugs in the software too. These
are fixed with patches and upgrades although they are far from free.
Switch software is proprietary and software engineers spend countless
hours slaving over hot keyboards writing it, making it VERY expensive.

That is a possibility, but the use of a cell connection in an
emergency does not automatically involve a mobile situation.
If not mobile, then there's never a need to hand off to a next
cell.

4016. Any HTX-242 Mods??

Newsgroup: rec.radio.amateur.equipment
Date: 1998-09-10 00:00:00 UTC
From: Paul Munsel <N5XMV@myriad.net>
Message-ID: <35F76D49.34BB@myriad.net>
Source record: 132509

I am looking for any Mods for the RS HTX-242 besides the mods listed in
the manual which allow a small amount of room for the CAP/MARS freqs.
Any info would be appreciated.
Paul N5XMV

Hi John OM,
You have to remember, ebay is not in the 'real' world, it is just the
SF Bay Area, HI! Too bad there is not an 'ebay' in some other part of
the country where prices paid for things are much lower.

I bid just under regular retail for an Edison Cygnet
Horn, only to find it relisted the next day saying that the
top bidder withdrew. I wrote immediately and agreed on a
price with the lister, for almost the highest amount, and
sent my check immediately. He held it 3 weeks and returned
the check, saying that the top bidder had decided to buy.
Right. He just found another buyer who paid more than he
had agreed to sell it to me for.

Manual/DC pwr cord
PRO-2046 Radio Shack scanner $100 + $10 shipping
29-890 Mhz, AM/FM, 100 channels
Box/Manual/DC pwr cord/Mobile bracket
Only 3 months old
IC-22U Icom 2 meter FM xcvr $75 + $10 shipping
10 watts,
DC pwr cord/manual/mobile bracket/mic
FT-230R Yaesu 2 meter FM xcvr $100 + $10 shipping
25 watts, Digital display, PL
TT mic/manual/DC pwr cord/mobile bracket
TRS04VD ARR (Advanced Receiver Research) $50 + $5 shipping
Sequencer
PPT in, 4 DPST relays out
Commercially manufactured unit
PC board only (not a kit)
MFJ-462B Multi digital mode LCD display terminal $60 + $5 shipping
AF in, displays: AMTOR/CW/RTTY/PACKET
DC pwr cord/manual
IC-751A Icom 100 watt HF xcvr/gen rcvr $600 + $20 shipping
160-10 meters, 32 men, AM/FM/CW/SSB
DC pwr cord/manual/mic/mobile bracket
This is an "A" model
The following IC-751A options will ONLY be made available
to the purchaser of the radio. The purchaser can pick and
chose which addition items he/she wants.
EX-310 Voice synthesizer $60
FL-53 250 Hz CW filter $60
RC-10 Direct freq 10 key pad $60
UX-14 CI-V computer interface $60
MFJ-941C Ant tuner w/meter $50
IC-751A + all above options, package: $800 + $20 shipping
Once the IC-751A is sold, any remaining options will be
posted and sold separately at that time.
TERMS:
1) Prices are for CONUS only
2) Send me an eMAIL message to reserve an item(s) which you want to
purchase. If I receive several requests for the same item(s), the tie
breaker will be the date/time stamp of the eMAIL messages. First in gets
the reservation, second in will go on wait list.
3) I will confirm your reservation via an eMAIL reply
4) Send US money order (no personal checks) to my home callbook mailing
address.
5) All money orders MUST be received by me within 7 days or the deal is
assumed canceled. The item will either go to the next person in line, or
relisted on the internet for sale.

6) I will ship UPS ground next day after receipt of your money order.

From:
Subject: Buying at hamfests
Some hamfests have a test table set up so you can run a piece of gear
before you bring it home. There are some BASIC things you can do to
protect yourself. 1. Give it a sniff test! Smell burned? Say goodbye.
2. The stripped screw test...Look at the hardware. Are the screws
stripped or worn? Does the sign say Never modified? Modify your walk
to the next table. 3. The dealer test. Now not every guy who shows up
at a hamfest with a U-haul filled with electronics is a dealer, but the
chances are greater his stuff will have been bought from someone else
and marked up. I would rather buy from an individual with a callsign
than a dealer with truckload of someone elses problems. (lighten up
guys...not all dealers are crooks, and not all individual sellers are
angels..)
4. The callsign test. If the guy hasn't gat a call or says the gear
belongs
to someone else and can't (or won't) supply a name...Walk on.
5. The story test. If there is a big story other than "I used it every day
and it works perfectly..." Say so long.
If I am buying anything of substance I get a name and phone number. I
have bought lots of used gear and have had only one problem that was
quickly resolved with a phone call and a trip to the local I bought the rig
from.
Oh yeah...6. The box and manual test. Hams are notorious for saving
everything that came with there radios. The first thing a CBer does
upon getting a new radio is to throw away the manual, box, and
reciept. No manual? No sale.
These are the things I look for. The more problems the lower the worth
of the piece in question....
All the above are IMHO...73 greg/W1XZ

>which may or may not be available in an emergency.
There are times when an "all stations" bulletin needs to be sent, and
amateur
radio excels at this, but most traffic *is* point to point. On a net, that
requires
everyone else to stand by while a pair of stations pass their traffic, then
stand
by as the next pair of stations pass their traffic, etc. This is very
inefficient.
Simplex nets can have the station pairs move off frequency to pass their
traffic, then return to the net, but repeater based nets can't do that
because
the stations involved typically aren't in simplex range of each other.
OTOH,
cellular inherently provides this one to one capability. Multiway calling
is also
an option, though in some ways more limiting than a conference bridge.
>It is not only the equipment that amateur radio provides, but a trained
>communicator who knows how to get a message through under adverse
conditions.
Amateurs may know how to use radios, but few are really trained in proper
message
handling procedures. Use of cellular requires very little training, but of
course skill
with message handling procedures is still required if verbatim copy is
required. But
many messages in disaster situations are tactical in nature, and can be
handled
verbally if the contact is direct between the responsible parties, and not
handled
through intermediaries such as amateur radio operators. Since virtually
anyone
can operate a cell phone, and since no license is required to do so, the
responsible
parties can use cell phones to directly communicate, eliminating the
amateur
middleman.
Where the amateur is of value is in off loading the communications chore
from
the responsible parties. In effect he acts as their secretary (amateurs
prefer to
call it shadowing). They can simply hand the radio to the principal after
establishing

contact, or take a formal message. But the same thing can be done via cellular or
wireline or any other available communications method. Amateurs should consider
themselves in the light of facilitating and off loading the communications chore
from their principals, and less in the light of just being radio operators. In that
respect, a handheld cell phone and a phone list are valuable tools to have at hand.
The amateur rig should be reserved for those situations where it serves best,
typically to monitor "all stations" bulletins, or to handle point to point messages
when cellular or wireline service is unavailable.
Even when amateurs are performing the eyes and ears role, and are in effect
one of the principals to the information transaction, amateur radio may not be
the best method to use. It is one tool, but the smart communicator won't limit
himself to only a single tool. If amateurs have a failing in their role to be
emergency communicators, I think this may be the major one. The idea that
when all you have is a hammer, every problem looks like a nail, is often very
much operative here. We should use the most appropriate tool, be that a ham
rig, a cell phone, a CB, an agency radio, wired phone, the internet, or a notepad
and a runner, for each message we are charged to handle. Different messages,
and different situations, require different methods. We should strive to be
flexible and efficient in order to get the job done in the best fashion possible
under the circumstances. We're there to meet the needs of our served agency,
whatever they may be, not just to play radioman.

Well John, all they would have to do is put a CW button on the cell phone
because we all know that "CW gets through when nothing else can".

> John D. Seney, WD1V
In June of this year, Elam Stolfus, TG7XQS, said on 20 Meters:
"Armed bandits kidnapped my wife, daughter, a nurse, and a visiting
missionary. Ham radio is my only means of communication to the outside
world.
Can you help us?"
Ed Petzolt, K1LNC heard the call for help, and amateur radio went to work.
Armed gunmen had kidnapped four missionaries from a compound in northern
Guatemala. Among those held for 2-million quetzales (around $300,000)
ransom
were the Barbara and Anita Stolfus, the wife and daughter of Elam Stolfus,
TG7XQS, and two others, including Otto, a missionary from Belize, and a
nurse, Jenni. Missionary Elam Stolfus promptly turned to ham radio, his
only
connection to the outside world, and K1LNC and TG7XQS coordinated
operations
of the Guatemalan police and armed forces. The bad guys lost, and all the
hostages were returned safely. Try that on your cell phone!

Are you saying that any analog cell can only handle 3 calls at a time?
Where did you get that?

Indeed that is the problem with ham radio today and in the future.
Enforcement. frankly a bill that allowed and required the FCC to
collect (in lumps at renewal) a few dolars a year form us Hams and to
reserve it for neforement, would do more for Ham radio than any Bill I
have seen lately
When outsiders look at Ham radio, Like I have too as part of
my job I see clumbs going every which way, and nothing worth the
trouble of planing to deal with. This is also dangerous to Ham radio

Subject: Did the Hams just lose 10 meters?
Exactly. Solid copy to a JX yesterday evening at 28.010 with 35 watts
using a 22 year old rig, a 1/4 wave ground plane and practically no
filter to speak of. If y'all don't want to bother with 10 meters
because of QRM, I'll be happy to have the extra clear space. The band
is far more usable and QRM far less obnoxious than 20 meters with it's
100,000 watt California and PR flamethrowers blazing away at 500 wpm
and overloading the front end of this rig to the point where I can't
hear my neighbor. 10 meters rocks.

My IC706 MkII is keeping very hot but apart of that it works without any
problem and it passed trough a experience of working at full power with 38
degrees celsius during several hours.
Still working very well.

No. 50 MHz is the lower limit. BTW: Better watch your
English

grammer next time.

Fred

Subject: POOR RESPONSE
Alinco is known for poor response. According to a former employee,the
reason
for one is that their U.S.branch manager is not a resident and rarely
visits
the branch. The person who claims to be the manager is actually the
"assistant" manager, more like a messenger. This explains why they have
poor
excuses for, from my point of view, half decent marketing policies. From my
speculation, I would expect the DJ-C1T (card radio mono band), DX-77(the
lowest HF and highest CB radio), and possibly VHF and dual band mobile
radios
will be on special sale from a mail-order discount store starting probably
October; this will outdo the existing dealers, but Alinco doesn't seem to
care about the past relationship with old dealers, and therefore, the old
users, who paid higher prices. Good thing, if any, is the DJ-X10T can
receive
blocked cellular band by reprogramming. Now you don't get this from Icom.

Subject: Want to make money fast?
Get 6 separate pieces of paper and write the following on each piece of
paper:
PLEASE ADD ME TO YOUR MAILING LIST.
$1 US DOLLAR PROCESSING FEE IN ENCLOSED.
PLEASE WRITE YOUR NAME, ADDRESS, CITY, STATE, ZIP ON THE PAPER.
(THIS IS KEY. THIS IS WHAT MAKES IT LEGAL SINCE YOU ARE PAYING FOR AND
LATER OFFERING A SERVICE).
Now get six $1.00 bills and place ONE inside EACH of the 6 pieces of
paper
so the bill will not be seen through the envelope to prevent
theft/robbery

(Using colored paper will help hide the dollar bill). Then, place one paper
in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase and a U.S.
$1.00 bill. Mail the 6 envelopes to the following addresses:
#1 George Powel
15582 Grape Creek Road
Danville, IL 61834
#2 Brad Wright
16363 N 300 W
Covington, IN 47932
#3 Max Farr
2720 B 1/4
Grand Junction, CO 81503
#4 Anthony Marcus
32 N Macquesten Pkwy
Mount Vernon NY
#5 I.M.O.
1966 Tice Valley Blvd. #502
Walnut Creek, CA 94595
#6 Tim Keller
3231 Betsy Ln.
Herndon, VA 20171
USA
STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list. (If you want to remain anonymous, put a nickname, but the
address MUST be correct. It, of course, MUST contain your country, state/district/area,zip code, etc!!! You wouldn't want your money to fly away, would you?!?!).
STEP 3: Now post your amended article to at least 200 newsgroups. Remember,
200 postings is just a guideline. The more you post, the more money you make!
NOTE: IN MANY NEWSGROUPS THERE ARE PEOPLE THAT DELETE THIS KIND OF MESSAGES
I RECOMMEND YOU TO POST 1 OR EVEN 2 TIMES A WEEK TO 300 NEWSGROUPS SO OTHER
PEOPLE CAN SEE YOUR MESSAGES. THIS IS A WAY TO INCREASE THE POSSIBILITIES
TO GET MORE MONEY!!
Don't know HOW to post in the news groups? Well do exactly the following:
HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:
The fastest way to post a newsletter:
Highlight and COPY(Ctrl-C) the text of this posted message and PASTE(Ctrl-V)it into a plain text editor (as Wordpad, Scrapbook, even AOL's mail)

and save it. After you have made the necessary changes that are stated above,
simply COPY(Ctrl-C) and PASTE(Ctrl-V) the text into the message composition
window, after selecting a newsgroup, and post it! (Or you can attach the file, without writing anything to the message window.)
If you have Netscape Navigator 3.0 do the following:
1. Click on any newsgroup like normal, then click on 'TO NEWS'. This will
bring up a box to type a message in.
2. Leave the newsgroup box like it is, change the subject box to something
flashy, something to catch the eye, as "$$$ NEED CASH $$$?!!", "READ HERE!$!$!$" or "$$$!!!MAKE FAST CASH!!!$$$". Or use your own subject title.
3. Now click on 'ATTACHMENTS'. Then click on 'ATTACH FILE'. Find your file
on your Hard Disk (the one you saved from the text editor). Once you find
it, click on it and then click 'OPEN' and 'OK'. You should now see your file name in the attachments box.
4. Now click on 'SEND'/'POST'. You see? Now you just have 199 to go!!! (Don't worry, it's easy and quick once you get used to it.)
NOTE: All the versions of Netscape Navigator's are similar to each other, so you'll have no problem doing this if you don't have Netscape Navigator 3.0.
(FOR A QUICK TIP)! Netscape Navigator 3.x and above)
